APPENDICES

- A: AIR QUALITY IMPACT ANALYSIS
- B: MOBILE SOURCE HEALTH RISK ASSESSMENT
- C: BIOLOGICAL SURVEY
- D: CULTURAL RESOURCES ASSESSMENT
- E: GEOTECHNICAL REPORT
- F: GREENHOUSE GAS ANALYSIS
- G: PHASE I ENVIRONMENTAL SITE ASSESSMENT
- H: NOISE IMPACT ANALYSIS
- I: TRIP GENERATION ASSESSMENT
- J: VEHICLE MILES TRAVELED SCREENING ANALYSIS
- K: ENERGY ANALYSIS

1.0 PROJECT INFORMATION

1. Project Title:

929 West Anaheim Street Industrial Project

2. Lead Agency Name and Address:

City of Long Beach
411 West Ocean Boulevard, 3rd Floor
Long Beach, CA 90802

3. Contact Person and Phone Number:

Maryanne Cronin, Planner
(562)570-5683

4. Project Location:

929 West Anaheim Street and 1401 San Francisco Avenue
(APNs: 7271-007-005, 7271-008-014, and 7271-008-016)

5. Project Applicant's Name and Contact Information:

929 West Anaheim Street, LLC
c/o Clark Neuhoﬀ for Alere Property Group LLC
100 Bayview Circle, Suite 310
Newport Beach, CA 92660

6. Preparation of this Compliance Checklist:

City of Long Beach, Department of Development Services

7. Required Project Approvals and Public Agencies Whose Approval is Required:

The proposed project would require the following discretionary entitlement approvals:

- Site Plan Review
- Lot Merger

8. Incorporation by Reference:

This Environmental Compliance Checklist may reference all or portions of another document that is a matter of public record or is generally available to the public. Informational details from the documents that have been incorporated by reference are summarized below. These documents include:

- a. General Plan Land Use Element (December 2019)
- b. General Plan Urban Design Element (December 2019)
- c. General Plan Land Use and Urban Design Elements Program Environmental Impact Report (PEIR) (December 2019)

This page intentionally left blank

2.0 PROJECT INFORMATION AND SETTING

2.1 GENERAL PLAN

The proposed 929 West Anaheim Street Industrial Project (project) site is designated as PlaceType Neo-Industrial (NI) (40-foot height limit) in the City of Long Beach (City) General Plan Land Use Element (2019). PlaceType NI is defined by restricted light industrial activities associated with innovative start-up businesses and creative design offices in the arts, engineering, sciences, technology, media, education, information industries, among others.

2.2 ZONING

The project is in the General Industrial (IG) Zoning District. The IG Zoning District is considered the City's "industrial sanctuary" district where a wide range of industries that may not be desirable in other districts may locate.

2.3 PROJECT DESCRIPTION

The approximately 6.65-acre project site is located at 929 West Anaheim Street and 1401 San Francisco Avenue and is developed with an outdoor pipe storage yard and 5,827-square-foot industrial building (Figure 1 - Project Site). The proposed project would include the development of two concrete tilt-up industrial buildings (62,042 square feet and 61,553 square feet, respectively) with surface parking (176 spaces) and associated landscaping. The project includes the remodel and reuse of a 5,827-square-foot industrial building on the consolidated site. A request to merge three (3) lots into a single 289,864-square-foot (6.65-acre) lot is included as part of the project approval.

Figure 1 - Project Site

The project would be a warehouse/manufacturing facility while accommodating the provisions of the Neo-Industrial overlay (Figure 2 – Site Plan). The project is comprised of two buildings totaling approximately 129,000 SF with no more than 25% of that space being office and no less than 50% being warehouse. The building footprints are 60,042 and 59,533 respectively with planned 2,000 SF of office mezzanine in each new building bringing the total square footage to 129,422 (62,042 and 61,533 respectively). An existing 5,827 building will be preserved in place and enhanced. Associated improvements to the Project site will include, but not be limited to, surface parking areas, vehicle drive aisles, landscaping, truck court, utility infrastructure, exterior lighting and signage. The project would include new public right-of-way improvements such as new curbs, gutters, sidewalks and landscaping. Enhancements to the existing industrial building at 1401 San Francisco Avenue would assure uniformity of design.

The buildings will be constructed of concrete tilt-up panels (Figure 3 – Elevations [North Building] and Figure 4 – Elevations [South Building]). Each new building will have a height of 38 feet with a vertical corner element for rooftop screening at 42-feet-5-inches. The architectural enhancements will include ample low-reflective glass, paint, and texture. Other aspects of the building design include fire sprinkler systems, 3 percent skylights and windows for maximum natural lighting, electric vehicle (EV) charging stations, 100 percent concrete drives and courts and offices in compliance with CALGreen and the intent of Leadership in Energy and Environmental Design (LEED) at the Certified Level.

Trucks will access the project site via either Anaheim Street from the south or Pacific Coast Highway from the north, both permitted truck routes, and exit the site via Pacific Coast Highway. Passenger cars will enter the project site via San Francisco Avenue from either Pacific Coast Highway, Anaheim Street or 16th Street. The facility could operate 24 hours a day, 365 days a year.

The project is estimated to begin construction in the Year 2021 and open for operations in the Year 2022. The construction process will include light demolition of fencing, lighting and asphalt paving, grading and building construction.

2.4 SURROUNDING LAND USES AND SETTING

The project site is located in an urbanized area that is bound by industrial properties to the east on San Francisco Avenue, the channelized Los Angeles River levy on the west, followed by Interstate 710 (I-710), and by industrial properties on the north and south (across West Anaheim Street).

- North – Industrial, Vacant City-owned parcel
- South – West Anaheim Street and Industrial
- West - Los Angeles River and Los Angeles River Bicycle Path, Vacant City-owned parcel
- East – Industrial

3.0 DETERMINATION

The environmental factors checked below would have a "Potentially Significant Impact" not identified in the General Plan Land Use and Urban Design Elements Certified Environmental Impact Report (EIR).

- | | | |
|---|---|--|
| ☐ Agricultural Resources | ☐ Aesthetics | ☐ Air Quality |
| ☐ Biological Resources | ☐ Cultural and Tribal Cultural Resources | ☐ Geology and Soils |
| ☐ Global Climate Change | ☐ Hazards and Hazardous Materials | ☐ Hydrology and Water Quality |
| ☐ Land Use and Planning | ☐ Mineral Resources | ☐ Noise |
| ☐ Population and Housing | ☐ Public Services | ☐ Recreation |
| ☐ Transportation | ☐ Utilities and Service Systems | ☐ Energy |
| ☐ Wildfire | | |

3.1 DETERMINATION

On the basis of this compliance checklist:

- ☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (a) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (b) has been addressed by mitigation measures based on the earlier analysis, as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☒ I find that although the proposed project could have a significant effect on the environment, because the range of potentially significant effects (a) has been analyzed adequately in the General Plan Land Use and Urban Design Elements Program Environmental Impact Report (PEIR) (certified December 2019) pursuant to applicable standards, and (b) has been contemplated, avoided, or mitigated pursuant to that 2019 PEIR, including revisions, adherence to standard conditions, uniformly applicable development policies, or mitigation measures that are imposed upon the proposed project, no further action is required.

4.0 FORMAT AND EVALUATION OF IMPACTS

4.1 FORMAT OF THIS ENVIRONMENTAL COMPLIANCE CHECKLIST

The City of Long Beach (City) General Plan Land Use and Urban Design Elements Program Environmental Impact Report (PEIR) analyzed potential environmental impacts of the implementation of the General Plan Land Use Element (LUE) and Urban Design Element (UDE) by utilizing the Initial Study Checklist Form included in Appendix G of the *State CEQA Guidelines*. The City determined that an EIR would be required for the implementation of the LUE and UDE, and issued a Notice of Preparation (NOP) and Initial Study in May 2015 (refer to Appendix A of the Recirculated Draft PEIR) which was distributed via the State Clearinghouse (SCH). The SCH issued a project number for the EIR (SCH No. 2015051054). The NOP process was used to help determine the scope of the environmental issues to be addressed in the Draft PEIR.

Preparation of the Draft PEIR began in June 2015 to fully evaluate the potential adverse environmental impacts that could result from implementation of the LUE and UDE. Issues considered Potentially Significant were addressed in the Draft PEIR. Issues identified as Less Than Significant or as No Impact were not addressed beyond the discussion contained in the Initial Study prepared for the LUE and UDE. The Draft PEIR was circulated for public review for an extended period of 78 days (33 days longer than the required 45-day public review period), from September 1, 2016 to November 18, 2016.

Due to extensive public input provided to the City in the form of written comments on the Draft PEIR, oral testimony at public hearings and community meetings, and direction from the City Council to revise the PlaceTypes Maps in the LUE, the City subsequently revised the LUE in March 2018. The changes were determined to constitute potentially significant new information, thereby requiring recirculation of the Draft PEIR pursuant to *State CEQA Guidelines*, Section 15088.5. As such, a Recirculated Draft PEIR was prepared to evaluate environmental impacts that could result from implementation of the LUE and UDE. The Recirculated Draft PEIR was circulated for public review for an extended period of 60 days (15 days longer than the required 45-day public review period), from June 18, 2019, to August 16, 2019. The Recirculated Draft PEIR found that implementation of the LUE and UDE would result in significant and unavoidable adverse impacts related to air quality, global climate change, noise, and transportation. With the exception of air quality, global climate change, noise, and transportation impacts, all other potentially significant impacts were effectively mitigated to a less than significant level. The City Council certified the Recirculated Draft PEIR in December 2019, adopted the Mitigation Monitoring and Reporting Program (MMRP), and approved the LUE and UDE. For purposes of the discussion in this Environmental Compliance Checklist, the Recirculated Draft PEIR is hereafter referred to as the 2019 PEIR.

The analysis in this Environmental Compliance Checklist includes all environmental topics analyzed in the 2019 PEIR prepared for the implementation of the LUE and UDE. A brief discussion of environmental topics determined to have no impacts or less than significant impacts and not addressed in the 2019 PEIR is also included as a narrative in the Environmental Compliance Checklist.

For each impact identified in this Environmental Compliance Checklist, a summary of the analysis in the 2019 PEIR and a statement of the level of significance of the impact are provided. Included in the analysis is a determination of whether the mitigation measures identified in the 2019 PEIR are applicable to the proposed project, and whether there are any additional impacts not previously identified in the 2019 PEIR, which would therefore require the implementation of new mitigation measures. Where components of certain mitigation measures identified in the 2019 PEIR are not applicable to the proposed project, they have been shown as stricken in the discussion.

The Environmental Compliance Checklist applies the following determination of impacts:

- Potentially Significant Impact Not Identified in the 2019 PEIR
- No Impact/No Change to the 2019 PEIR

4.2 EVALUATION OF ENVIRONMENTAL IMPACTS

CEQA requires a Lead Agency to consider the information contained in the EIR prior to taking any discretionary action on the proposed project. According to Section 15168(c)(2) of the *State CEQA Guidelines*, a Program EIR can be used in compliance with CEQA to address the effects of a subsequent activity, as long as the activity of the project is within the scope of the Program EIR, and no new effects are found and no new mitigation measures are required. According to Section 15162 of the *State CEQA Guidelines*, when a Program EIR has been certified for a project, no new subsequent EIR needs to be prepared as long as the activity of the project is within the scope of the Program EIR, and no new effects are found and no new mitigation measures are required.

In addition, *State CEQA Guidelines* Section 15183 allows streamlining for projects that are consistent with the development density established by existing zoning, community plan, or general plan policies for which an EIR was certified. Section 15183(c) states that if an impact is not peculiar to the parcel or to the project, has been addressed as a significant effect in the prior EIR, or can be substantially mitigated by the imposition of uniformly applied development policies or standards, an additional EIR need not be prepared for the project solely on the basis of that impact.

Per *State CEQA Guidelines* Section 15183(b), in approving such projects, the Lead Agency may limit the examination of environmental effects to the following in an Initial Study or other analysis, where the environmental effects:

1. Are peculiar to the project or the parcel on which the project would be located;
2. Were not analyzed as significant effects in a prior EIR for the general plan, community plan, or zoning action with which the project is consistent;
3. Are potentially significant off-site impacts and cumulative impacts that were not discussed in a prior EIR prepared for the general plan, community plan, or zoning action; or
4. Are previously identified significant effects which, as a result of substantial new information which was not known at the time the prior EIR was certified, are determined to have a more severe adverse impact than discussed in the prior EIR.

Projects are eligible if the project is consistent with the General Plan for which an EIR was certified by the Lead Agency.

As supported by the analysis presented in this document, the proposed project would not result in new or substantially more severe significant environmental impacts than were analyzed in the 2019 PEIR.

This environmental compliance review is intended to serve as an informational document to be considered by the City and its decision-making bodies during deliberations and actions on the proposed project. The analysis contained herein constitutes the substantial evidence required to make a determination whether further environmental analysis for the proposed project is required.

This page intentionally left blank

5.0 ENVIRONMENTAL COMPLIANCE CHECKLIST

This checklist examines the impact determinations of the 2019 PEIR, potential impacts of the proposed project, and summarizes applicable compliance measures,¹ mitigation measures, and project design features included in the 2019 PEIR. This chapter is divided into sections based on the Environmental Analysis sections included in the 2019 PEIR. This checklist also includes a brief discussion of environmental topics that were determined to have less than significant impacts or no impacts, and were therefore not addressed in the 2019 PEIR. For consistency and ease of comparison, the threshold numbering reflects the numbering in the 2019 PEIR.

¹ Compliance measures are regulatory measures sometimes referred to as standard conditions of approval.

5.1 AGRICULTURAL RESOURCES

Based on the Initial Study for the 2019 General Plan PEIR (Appendix A in the 2019 General Plan PEIR), all significance thresholds for agricultural resources were identified as having no impacts.

The proposed project is an example of a non-agricultural infill site that was previously developed and is now developed with an outdoor pipe storage yard and industrial building. The site would be redeveloped for industrial use under the proposed project. Therefore, implementation of the proposed project would not result in environmental changes that could result in the conversion of farmland to non-agricultural use or the conversion of forest land to non-forest use. Furthermore, the adopted LUE encourages the creation of small-scale agricultural uses (e.g., community gardens, edible gardens, and small urban farms) (LU Policy 11-3, LU Policy 18-3, LU-M-40, and LU-M-88). Therefore, there are no effects peculiar to the project or project site or substantial new information that would result in new or more severe adverse impacts than discussed in the prior EIR and impacts with respect to agricultural and forestry resources are not evaluated further for the proposed project.

5.2 AESTHETICS

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Except as provided in Public Resources Code Section 21099, would the project:				
4.1.1	Have a substantial adverse effect on a scenic vista?	Less than Significant Impact	☐	☒
4.1.3	In a non-urbanized area, substantially degrade the existing visual character or quality of public views of the site and its surroundings? If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	Less than Significant Impact	☐	☒
4.1.4	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	Less than Significant Impact	☐	☒

The Initial Study prepared for the 2019 PEIR determined that implementation of the LUE and UDE would not result in impacts to State-designated scenic highways (Threshold 4.1.2) because there are no State-designated scenic highways in the planning area. Therefore, impacts with respect to this threshold are not evaluated further for the proposed project.

Impact Analysis

4.1.1 Would the project have a substantial effect on a scenic vista?

As described in the 2019 PEIR, through implementation of the UDE, Ocean Boulevard and Livingston Drive continue to be treated as scenic routes. Because the project site is located approximately 1 mile from Ocean Boulevard, views of this resource are not expected to be altered by the proposed project. The City's existing Open Space Element requires the protection of scenic features in the City, including beaches, bluffs, wetlands, and water bodies. Because the project site is located approximately 1.5 mile from the Pacific Ocean, views of this resource are not expected to be altered by the proposed project. In addition, the proposed project would be designed according to the development strategies, policies, and standards in the UDE as interpreted by the Site Plan Review Committee and would be subject to height and density/intensity limitations for PlaceType NI as outlined in the LUE, including the 40-foot height limit in the LUE. Because the proposed project falls within the range of what was contemplated in the 2019 PEIR and will be consistent with the design goals and provisions of the 2019 PEIR, no new potentially significant impact would occur. Finally, pursuant to Section 21099 of the Public Resources Code, this is a qualifying infill project in a transit priority area and is therefore exempt from having to evaluate impacts to aesthetics. Further study of this issue is not warranted.

4.1.3 In a non-urbanized area, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point.) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

As discussed in the 2019 PEIR, the visual character and quality of the City would be preserved and enhanced through the application of goals, policies, strategies, and development standards outlined in the LUE and UDE. Specifically, the proposed project would further UDE Strategy No. 25 through the development of an industrial project along the edge of the Los Angeles River that would act as a buffer to interior portions of the NI PlaceType in this portion of the City. The orientation of the project would encourage a development intensity that is graduated as the NI PlaceType areas east of the site are of a variety of size and scale in comparison to the larger parcel sizes along the Los Angeles River. Additionally, the proposed project complies with UDE Strategy No. 15 by using a vacant parcel (outdoor pipe storage yard) as an infill opportunity. The proposed project has been required to submit detailed plans to the City to ensure consistency with the City's design requirements (including those outlined in the UDE). The proposed project would be consistent with the development standards for the IG Zoning District. Because the project falls within the range of what was contemplated in the 2019 PEIR, will be consistent with the design goals and provisions of the 2019 PEIR, will be consistent with the City's Zoning Code, and will not conflict with other regulations governing scenic quality, no new potentially significant impact would occur. Finally, pursuant to Section 21099 of the Public Resources Code, this is a qualifying infill project in a transit priority area and is therefore exempt from having to evaluate impacts to aesthetics. Further study of this issue is not warranted.

4.1.4 Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

The 2019 PEIR found that future development facilitated by the 2019 PEIR would introduce new sources of light to the City that are typical of development projects. As such, the proposed project falls within the range of what was contemplated in the 2019 PEIR. Although the proposed project would introduce new sources of light that would contribute to the light visible in the night sky and surrounding area, the proposed project is located within a highly urbanized area that is characterized by significant nighttime lighting. Additionally, as described in the 2019 PEIR, the City reviews site plans and architectural renderings for new projects with an emphasis on the presence of reflective materials and proposed lighting to minimize potential impacts related to light and glare. A final lighting plan and photometric study detailing all exterior lighting fixtures and light standards will be required in the project's building permit submittal as a condition of approval. With City approval of a final lighting plan, no new impact related to lighting and glare beyond that identified in the 2019 PEIR would occur, and further study of the issue is not warranted. Finally, pursuant to Section 21099 of the Public Resources Code, this is a qualifying infill project in a transit priority area and is therefore exempt from having to evaluate impacts to aesthetics.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

Pursuant to Section 21099 of the Public Resources Code, as a qualifying infill project in a transit priority area, the proposed project is exempt from having to evaluate impacts related to aesthetics. The proposed project is designed in compliance with applicable LUE and UDE goals, strategies and policies intended to reduce the visual impacts of development contemplated under the 2019 PEIR including this project. There are no applicable compliance measures or project design features from the 2019 PEIR related to aesthetics. No mitigation for subsequent projects was identified in the 2019 PEIR.

5.3 AIR QUALITY

Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations.

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:				
4.2.1	Conflict with or obstruct implementation of the applicable air quality plan?	Significant and Unavoidable Impact	☐	☒
4.2.2	Violate any air quality standard or contribute to an existing or projected air quality violation?	Significant and Unavoidable Impact	☐	☒
4.2.3	Expose sensitive receptors to substantial pollutant concentrations?	Significant and Unavoidable Impact	☐	☒
4.2.4	Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	Less than Significant Impact	☐	☒

Impact Analysis

4.2.1 *Would the project conflict with or obstruct implementation of the applicable air quality plan?*

As described in the 2019 PEIR, CEQA requires that general plans be evaluated for consistency with the Air Quality Management Plan (AQMP). There were two key indicators of consistency with the AQMP analyzed in the 2019 PEIR. Indicator 1 related to whether the LUE/UDE would result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timely attainment of the ambient air quality standards (AAQS) or emission reductions in the AQMP. Indicator 2 related to whether the LUE/UDE would exceed the assumptions in the AQMP. Based on the emissions modeling prepared for the LUE/UDE, emissions under future with project conditions exceeded South Coast Air Quality Management District (SCAQMD) thresholds for volatile organic compounds (VOCs) and carbon monoxide (CO) as a result of additional housing anticipated under the LUE/UDE. Therefore, the 2019 PEIR determined that the LUE/UDE would result in a potentially significant impact associated with consistency with the applicable AQMP, and would not be consistent with the AQMP under the first indicator. Based on the requirements for consistency with emission control strategies in the AQMP, the 2019 PEIR determined that the LUE/UDE is consistent with the 2016 AQMP's land use policies aimed at reducing air quality emissions and would not increase unanticipated population or employment in the City. Therefore, the LUE/UDE is consistent with the 2016 AQMP under Indicator 2. While the LUE/UDE is consistent with the 2016 AQMP's land use policies aimed at reducing air emissions and would not increase anticipated population or employment in the City, the LUE/UDE would result in

additional housing units that would generate VOC and CO emissions above established SCAQMD thresholds. Therefore, based on the requirements for consistency with emissions control strategies in the AQMP, the LUE/UDE would conflict with or obstruct the implementation of the AQMP and/or applicable portions of the State Implementation Plan (SIP). As such, the 2019 PEIR determined that this impact would be significant and unavoidable.

The proposed project is consistent with the Land Use PlaceType identified for the project site in the 2019 PEIR; therefore, similar to the PEIR, the proposed project is consistent with the 2016 AQMP's land use policies aimed at reducing air emissions (Indicator 2). As demonstrated by the Air Quality Impact Analysis prepared for the proposed project (Appendix A) and as shown in Thresholds 4.2.2 through 4.2.4 below, the proposed project would not generate emissions that exceed SCAQMD thresholds. Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

4.2.2 Would the project violate any air quality standard or contribute to an existing or projected air quality violation?

Construction Emissions. As described in the 2019 PEIR, while existing City policies and regulations and the proposed LUE/UDE goals and policies are intended to minimize impacts associated with nonattainment criteria pollutants, the 2019 PEIR determined that this impact was significant and unavoidable since the combination, number, and sizes of projects that could be under construction at any one time were unknown. The 2019 PEIR requires Compliance Measure CM AQ-1. Compliance Measure CM AQ-1 includes a list of measures within the existing regulatory framework that future projects may be required to comply with based on their specific impacts to ensure that the intended environmental protections were achieved. Additionally, the 2019 PEIR required the implementation of Mitigation Measure MM AQ-1, which requires the preparation of project-specific technical assessments evaluating construction-related air quality impacts to further ensure that construction related emissions are reduced to the maximum extent feasible.

The Air Quality Impact Analysis prepared for the proposed project (Appendix A), calculated peak daily emissions associated with the on-site construction equipment, on-road haul trucks and vendor trips, and fugitive dust emissions during each of the construction tasks using the California Emissions Estimator Model (CalEEMod, version 2016.3.2). As shown in Table 3-5 of the Air Quality Impact Analysis Memorandum (Appendix A), construction emissions associated with the project would not exceed the SCAQMD's thresholds for VOC, nitrogen oxides (NO_x), CO, sulfur oxides (SO_x), particulate matter less than 10 microns in size (PM¹⁰) emissions, and particulate matter less than 2.5 microns in size (PM_{2.5}). Therefore, construction of the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or State AAQS. Because the project construction-related air quality impacts were evaluated within the Air Quality Impact Analysis (Appendix A) and impacts were determined to be less than significant, Mitigation Measure MM AQ-1 is not applicable to the proposed project. However, the proposed project would implement standard Best Management Practices (BMPs) during construction, as required by Compliance Measure CM AQ-1 within the 2019 PEIR. Furthermore, the proposed project would not substantially increase the severity of previously

identified impacts in the 2019 PEIR, and no new construction-related impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Operation Emissions. The 2019 PEIR determined that emissions associated with the anticipated General Plan build out would not exceed the daily SCAQMD regional thresholds for VOC, NO_x, PM₁₀, and PM_{2.5}, and CO in 2040 when compared to the existing conditions (2018) scenario. However, the decrease in emissions was associated with the overall decrease in vehicle miles traveled (VMT) and reduction in vehicle emission rates that would occur with or without the LUE/UDE. Therefore, the 2019 PEIR analyzed the change in emissions associated with the LUE/UDE, holding the emission factors constant for the year 2040. This analysis indicated that both VOC (an ozone [O₃] precursor emission) and CO emissions would exceed the SCAQMD thresholds under this scenario. Future development under the LUE/UDE is required to demonstrate compliance with the AQMP, the SIP, the California Air Resources Board's (CARB) motor vehicle standards; SCAQMD regulations for stationary sources and architectural coatings; the California Green Building Standards Code (CALGreen Code) building efficiency standards (Title 24, Part 11) and the California Energy Code Building Energy Efficiency Standards (Title 24, Part 6); and the proposed LUE/UDE project goals and policies. The 2019 PEIR also requires the implementation of Mitigation Measure MM AQ-2, which requires the preparation of project-specific technical assessments to ensure that operational-related emissions are reduced to the maximum extent feasible. However, because operational characteristics and the associated emissions for future specific development projects could not be determined at the time of the analysis, despite implementation of Mitigation Measure MM AQ-2, the potential emissions impacts associated with the operation of the LUE/UDE were determined to be significant and unavoidable.

The Air Quality Impact Analysis prepared for the proposed project (Appendix A) calculated long-term operational emissions associated with the proposed project using CalEEMod. The results shown in Table 3-8 indicate that the proposed project would not exceed the significance criteria for daily VOC, NO_x, CO, SO_x, PM₁₀, or PM_{2.5} emissions. The peak operational emissions presented in Table 3-11 of the Air Quality Impact Analysis (Appendix A) show the project's operational emissions compared to the adopted land use under the LUE. As shown in Table 3-11, the proposed project is anticipated to generate slightly more emissions per day for pollutants of VOC, NO_x, CO, SO_x, PM₁₀, and PM_{2.5} when compared to the emissions generated by currently adopted general plan land use assumed for the Project site by the LUE PEIR. Despite the slight increase based on site conditions, the project emissions do not exceed the SCAQMD significance criteria or the overall emissions identified in the PEIR. Because the project operation related air quality impacts were already evaluated within the Air Quality Impact Analysis Memorandum (Appendix A) and impacts were determined to be less than significant, Mitigation Measure MM AQ-2 is not applicable to the proposed project. Furthermore, because the proposed project is within the overall range of what was contemplated in the 2019 PEIR, it would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

CO Hot-Spot Analysis. Under existing and future vehicle emissions rates analyzed in the 2019 PEIR, a project had to increase traffic volumes at a single intersection by more than 44,000 vehicles per hour—or 24,000 vehicles per hour where vertical and/or horizontal air does not mix—in order to

generate a significant CO impact. The anticipated General Plan build out would not have produced the volume of traffic required to generate a CO hot spot. Therefore, the 2019 PEIR determined that the implementation of the LUE/UDE would not result in CO hot spots, impacts would be less than significant, and no mitigation was required.

Because the proposed project falls within the range of what was contemplated in the 2019 PEIR, it would not produce the volume of traffic required to generate a CO hot spot, impacts would remain less than significant. Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

4.2.3 Would the project expose sensitive receptors to substantial pollutant concentrations?

Localized Criteria Pollutants. As described in the 2019 PEIR, construction emissions associated with future individual projects developed under the LUE/UDE would have the potential to cause or contribute to significant localized air quality impacts to nearby residential land uses within the planning area. To address this, the 2019 PEIR includes regulatory measures (e.g., SCAQMD Rule 201 for a permit to operate, Rule 403 for fugitive dust control, Rule 1113 for architectural coatings, Rule 1403 for new source review, and the CARB's Airborne Toxic Control Measures), and mitigation would be imposed at the project level, if necessary, which may include use of special equipment. As previously stated and as demonstrated by the Air Quality Impact Analysis prepared for the proposed project (Appendix A), the proposed project would not exceed SCAQMD significant criteria for criteria pollutants during either project construction or operation (Tables 3-13 and 3-15, respectively). Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, no project-level mitigation would be required, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Health Effects. As determined in the 2019 PEIR, localized construction impacts of future projects have the potential to exceed Localized Significance Thresholds (LSTs), particularly for construction of areas larger than 5 acres or areas with more intense construction activities. Therefore, the 2019 PEIR determined that without mitigation, exceedances of the LSTs have the potential to cause or exacerbate an exceedance of the AAQS. SCAQMD is only able to correlate potential health outcomes for very large emissions sources; specifically, 6,620 pounds per day (lbs/day) of NO_x and 89,180 lbs/day of VOCs would be expected to result in approximately 20 premature deaths per year and 89,947 school absences due to ozone. It was not expected that any future projects would generate 6,620 lbs/day of NO_x or 89,180 lbs/day of VOC emissions. However, individual projects would still be required to conduct a site-specific localized impact analysis that evaluates potential project health impacts at a project level to immediately adjacent land uses (refer to Compliance Measure CM AQ-1 and Mitigation Measure MM AQ-1 in the 2019 PEIR) to ensure that potential health impacts associated with the construction of the LUE/UDE would be less than significant. The proposed project would generate up to 61.04 lbs/day of NO_x during construction and 17.48 lbs/day of NO_x during operations (0.92% and 0.26% of 6,620 lbs/day, respectively). Additionally, the proposed project would also generate a maximum of 30.50 lbs/day of VOC emissions during construction and 4.52 lbs/day of VOC emissions during operations (0.03% and 0.01% of 89,190 lbs/day, respectively).

Therefore, the proposed project's emissions are not sufficiently high enough to use a regional modeling program to correlate health effects on a basin-wide level.

The Mobile Source Health Risk Assessment (Appendix B) prepared for the proposed project has been conducted in accordance with the guidelines in the *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (SCAQMD)*. The potential project-related TAC source cancer and non-cancer risks were analyzed under three exposures: Individual Exposure Scenario, Worker Exposure Scenario, and School Child Exposure Scenario. As analyzed in Appendix B, the project will not cause a significant human health or cancer risk to adjacent residences, workers, or nearby schools.

Because the project construction-related air quality impacts were evaluated within the Air Quality Impact Analysis (Appendix A) and Mobile Source Health Risk Assessment (Appendix B) and impacts were determined to be less than significant, Mitigation Measure MM AQ-1 is not applicable to the proposed project. However, the proposed project would implement standard BMPs during construction, as required by Compliance Measure CM AQ-1 within the 2019 PEIR. Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Toxic Air Contaminant (TAC) Emissions. As described in the 2019 PEIR, the LUE/UDE includes a number of goals and policies that are intended to minimize TAC impacts associated with sensitive receptors. In addition, specific measures for future development projects are required to ensure that the intended environmental protections are achieved. Compliance with Policy 16-13 and Mitigation Measure MM AQ-3 required by the 2019 PEIR would ensure that mobile sources of TACs not covered under SCAQMD permits are considered during subsequent project-level environmental review. Policy 16-13 and Mitigation Measure MM AQ-3 also requires the preparation of project-specific technical health risk assessments for certain large discretionary industrial or warehousing uses to evaluate operational-related health risk impacts to ensure that operational-related emissions are reduced to the maximum extent feasible for projects that require environmental evaluation under CEQA. However, because the scale of individual project-level emissions that would result under implementation of the LUE are unknown, and in order to present conservative assumptions, the TAC health risk impacts associated with future operation of individual projects resulting from implementation of the LUE/UDE were assumed to be potentially significant.

The proposed project is within the range of what was considered in the 2019 PEIR and would be consistent with goals and policies included in the LUE/UDE that are intended to minimize TAC impacts associated with sensitive receptors. The Mobile Source Health Risk Assessment (Appendix B) prepared for the proposed project to evaluate the potential health risk impacts to sensitive receptors (which are residents) and adjacent workers associated with the development of the proposed project, more specifically, health risk impacts as a result of exposure to TACs including diesel particulate matter (DPM) as a result of heavy-duty diesel trucks accessing the site. As demonstrated in Table ES-1 and analysis of Appendix B, the project would not exceed the significance threshold (risk per million) established for the 30-year/25-year and annual average for the individual receptor and worker receptor, respectively.

Potential TAC-related health risk impacts were analyzed at the project level and would not exceed the thresholds of significance and impacts would be less than significant. Therefore, Policy 16-13 and Mitigation Measure MM AQ-3 would not be applicable to the proposed project. The proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

4.2.4 Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

As described in the 2019 PEIR, during construction activities, construction equipment exhaust and application of asphalt and architectural coatings would temporarily generate odors as a result of implementation of the LUE/UDE. However, any construction-related odor emissions would be temporary and intermittent. Additionally, noxious odors would be confined to the immediate vicinity of the construction equipment and would be unlikely to affect a substantial number of people. In addition, by the time such emissions reached any sensitive receptor sites, they would be diluted to well below any level of air quality concern. Furthermore, short-term construction-related odors are expected to cease upon the drying or hardening of the odor-producing materials. Therefore, the 2019 PEIR determined that impacts associated with construction-generated odors would be less than significant.

While odor sources are present within the City, the odor policies enforced by the SCAQMD, including Rule 402, and City of Long Beach Municipal Code Section 8.64.040, prohibit nuisance odors and identify enforcement measures to reduce odor impacts to nearby receptors. Therefore, the 2019 PEIR determined that impacts associated with objectionable odors would be less than significant, and no mitigation was required.

The Project does not contain land uses typically associated with emitting objectionable odors. Standard construction requirements would minimize odor impacts from construction. The construction odor emissions would be temporary, short term, and intermittent in nature and would cease upon completion of the respective phase of construction and is thus considered less than significant. It is expected that project-generated refuse would be stored in covered containers and removed at regular intervals in compliance with the solid waste regulations.

Additionally, the proposed project would comply with the odor policies enforced by the SCAQMD, including Rule 402, and City of Long Beach Municipal Code Section 8.64.040. Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

Compliance measures are regulations imposed uniformly by the approving agency based on the proposed action taken and are required for the proposed project to reduce its potential environmental effects. Because these features are standard requirements, they do not constitute

mitigation measures. As described above, the following compliance measure from the 2019 PEIR would apply to the proposed project and has been determined to be feasible.

- CM AQ-1** To ensure compliance with South Coast Air Quality Management District (SCAQMD) rules and provide Best Management Practices (BMPs) to reduce air pollutant emissions during construction of ~~future projects facilitated under~~ the proposed project, the construction contractor shall implement the following BMPs during construction, where feasible, to further reduce emissions from construction emissions of volatile organic compounds (VOCs), nitrogen oxides (NO_x), and particulate matter:
- Install temporary construction power supply meters on site and use these to provide power to electric power tools whenever feasible. If temporary electric power is available on site, forbid the use of portable gasoline- or diesel-fueled electric generators.
 - Use of diesel oxidation catalysts and/or catalyzed diesel particulate traps on diesel equipment, as feasible.
 - Maintain equipment according to manufacturers' specifications.
 - Restrict idling of equipment and trucks to a maximum of 5 minutes (per California Air Resources Board [CARB] regulation).
 - Phase grading operations to reduce disturbed areas and times of exposure.
 - Avoid excavation and grading during wet weather.
 - Limit on-site construction routes and stabilize construction entrance(s).
 - Remove existing vegetation only when absolutely necessary.
 - Sweep up spilled dry materials (e.g., cement, mortar, or dirt track-out) immediately. Never attempt to wash them away with water. Use only minimal water for dust control.
 - Store stockpiled materials and wastes under a temporary roof or secured plastic sheeting or tarp.
 - Properly dispose of all demolition wastes. Materials that can be recycled from demolition projects include: metal framing, wood, concrete, asphalt, and plate glass. Unusable, un-recyclable debris should be confined to dumpsters, covered at night, and taken to a landfill for disposal. Hazardous debris such as asbestos must be handled in accordance with specific laws and regulations and disposed of as hazardous waste. For more information on asbestos handling and disposal regulations, contact the SCAQMD.

For the reasons outlined above, Mitigation Measures MM AQ-1 through MM AQ-3 are applicable to this project and would be required to ensure project impacts related to air quality are less than significant.

MM AQ-1 Prior to issuance of any construction permits, future development projects subject to discretionary review under the California Environmental Quality Act (CEQA) shall prepare and submit to the Director of the City of Long Beach (City) Department of Development Services, or designee, a technical assessment evaluating potential project construction-related air quality impacts. The evaluation shall be prepared in conformance with South Coast Air Quality Management District (SCAQMD) methodology for assessing air quality impacts. If construction-related criteria air pollutants are determined to have the potential to exceed the SCAQMD-adopted thresholds of significance, the Department of Development Services shall require that applicants for new development projects incorporate mitigation measures to reduce air pollutant emissions during construction activities. These identified measures shall be incorporated into all appropriate construction documents (e.g., construction management plans) submitted to the City and shall be verified by the Department of Development Services. Mitigation measures to reduce construction-related emissions include, but are not limited to, the following:

- Require the following fugitive-dust control measures:
 - o Use nontoxic soil stabilizers to reduce wind erosion.
 - o Apply water every 4 hours to active soil-disturbing activities.
 - o Tarp and/or maintain a minimum of 24 inches of freeboard on trucks hauling dirt, sand, soil, or other loose materials.
- Use construction equipment rated by the United States Environmental Protection Agency (USEPA) as having Tier 4 (model year 2008 or newer) emission limits (when available), or Tier 3 (model year 2006 or newer), applicable for engines between 50 and 750 horsepower.
- Ensure that construction equipment is properly serviced and maintained to the manufacturers' standards.
- Limit nonessential idling of construction equipment to no more than 5 consecutive minutes.
- Using Super-Compliant volatile organic compound (VOC) paints for coating of architectural surfaces whenever possible. (A list of Super-Compliant architectural coating manufacturers can be found on the SCAQMD website at http://www.aqmd.gov/prdas/brochures/Super-Compliant_AIM.pdf.)

- Suspend all soil disturbance activities when winds exceed 25 miles per hour (mph) as instantaneous gusts or when visible plumes emanate from the site and stabilize all disturbed areas.
- Post a publicly visible sign with the telephone number and person to contact at the City of Long Beach regarding dust complaints. The SCAQMD's phone number shall also be visible to ensure compliance with applicable regulations.
- Sweep all streets at least once a day using SCAQMD Rule 1186, 1186.1 certified street sweepers or roadway washing trucks if visible soil materials are carried to adjacent streets. The use of water sweepers with reclaimed water is recommended.
- Apply water three times daily or non-toxic soil stabilizers according to manufacturers' specifications to all unpaved parking or staging areas, unpaved road surfaces, or to areas where soil is disturbed. Reclaimed water should be used when available.
- Construction vendors, contractors, and/or haul truck operators shall utilize 2010 model year trucks (e.g., material delivery trucks and soil import/export) that meet the California Air Resources Board's (CARB) 2010 engine emission standards at 0.01 grams per brake horsepower-hour (g/bhp-hr) of particulate (PM) and 0.20 g/bhp-hr of nitrogen oxides (NO_x) emissions or newer, cleaner trucks. Operators shall maintain records of all trucks associated with the project construction to document that each truck used meets these emission standards, and shall make the records available for inspection.

MM AQ-2

Prior to future discretionary project approval, development project applicants shall prepare and submit to the Director of the City Department of Development Services, or designee, a technical assessment evaluating potential project operation phase-related air quality impacts. The evaluation shall be prepared in conformance with SCAQMD methodology in assessing air quality impacts. If operation-related air pollutants are determined to have the potential to exceed the SCAQMD-adopted thresholds of significance, the Department of Development Services shall require that applicants for new development projects incorporate mitigation measures to reduce air pollutant emissions during operational activities. The identified measures shall be included as part of the Project Conditions of Approval. Possible mitigation measures to reduce long-term emissions include but are not limited to:

- For site-specific development that requires refrigerated vehicles, the construction documents shall demonstrate an adequate number of electrical service connections at loading docks for plugging in the anticipated number of refrigerated trailers to reduce idling time and emissions.

- Applicants for manufacturing and light industrial uses shall consider energy storage and combined heat and power in appropriate applications to optimize renewable energy generation systems and avoid peak energy use.
- Site-specific developments with truck delivery and loading areas and truck parking spaces shall include signage as a reminder to limit idling of vehicles while parked for loading/unloading in accordance with CARB Rule 2845 (13 California Code of Regulations [CCR] Chapter 10, Section 2485).
- Require that 240-volt electrical outlets or Level 3 chargers be installed in parking lots that would enable charging of neighborhood electric vehicles (NEVs) and/or battery powered vehicles.
- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs throughout the City to generate solar energy.
- Maximize the planting of trees in landscaping and parking lots.
- Use light-colored paving and roofing materials.
- Require use of electric or alternatively fueled street-sweepers with HEPA filters.
- Require use of electric lawn mowers and leaf blowers.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Use of water-based or low volatile organic compound (VOC) cleaning products.

MM AQ-3

Prior to future discretionary approval for projects that require environmental evaluation under CEQA, the City of Long Beach shall evaluate new development proposals for new industrial or warehousing land uses that (1) have the potential to generate 100 or more diesel truck trips per day or have 40 or more trucks with operating diesel-powered transport refrigeration units, and (2) are within 1,000 feet of a sensitive land use (e.g., residential, schools, hospitals, or nursing homes), as measured from the property line of the project to the property line of the nearest sensitive use. Such projects shall submit a Health Risk Assessment (HRA) to the City Department of Development Services. The HRA shall be prepared in accordance with policies and procedures of the most current State Office of Environmental Health Hazard Assessment (OEHHA) and the SCAQMD. If the HRA shows that the incremental health risks exceed their respective thresholds, as established by the SCAQMD at the time a project is considered, the Applicant will be required to identify and demonstrate that best available control technologies for toxics (T-BACTs), including appropriate enforcement mechanisms to reduce risks to an acceptable level. T-BACTs may include, but are not limited to, restricting idling on site or electrifying warehousing docks to reduce diesel particulate matter, or

requiring use of newer equipment and/or vehicles. T-BACTs identified in the HRA shall be identified as mitigation measures in the environmental document and/or incorporated into the site plan.

5.4 BIOLOGICAL RESOURCES

Based on the Initial Study for the 2019 General Plan PEIR (Appendix A in the 2019 General Plan PEIR), all significance thresholds for biological resources were identified as having less than significant or no impacts. In its existing setting, the planning area is almost entirely developed and is located in an urban area of Los Angeles County. These urban areas do not contain mapped habitat for any sensitive biological species as identified in local/regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or the United States Fish and Wildlife Service (USFWS).

In order to preserve open space areas and protect sensitive biological resources, the adopted LUE promotes compact infill development on underutilized parcels located throughout the City (LU Policy 1-5, LU Policy 7-11, and Major Area of Change No. 7). The majority of parcels proposed for infill development are either paved or developed with uses that would be redeveloped as part of the proposed project. As such, these areas have previously been heavily disturbed and do not support sensitive biological resources.

The proposed project is an example of an infill site that was previously developed and would be redeveloped under the proposed project. The site is presently used as an outdoor pipe storage yard and industrial building and is void of vegetation capable of supporting habitat. The project would include the installation of landscaping onsite. The Biological Survey prepared for the proposed project (Appendix C) did not identify biological constraints at the project site. The site has very limited value to native plants and wildlife due to the disturbed and developed nature of the site and the complete absence of native habitats onsite.

Furthermore, the adopted LUE establishes the Open Space PlaceType, which would encourage the preservation of existing wildlife habitat areas and would protect existing water bodies and habitat areas with known sensitive biological resources (Major Area of Change No. 8, LU Strategy No. 20, and LU Policies 20-1 through 20-4). Therefore, the adopted LUE would protect and retain open space areas and would not have a substantial adverse effect on species identified as candidate, sensitive, or special-status species in local or regional plans, policies, or regulations by the CDFW or the USFWS, nor would the LUE have a substantial adverse effect on riparian habitat and other sensitive natural communities, or federally protected wetlands.

Implementation of the proposed project would not result in impacts related to interference with the movement of species within wildlife corridors. Specifically, LU Policy 20-12 in the adopted LUE requires that future development projects in the City comply with the Migratory Bird Treaty Act (Title 33, United States Code [USC], Section 703 et seq., see also Title 50, Code of Federal Regulations [CFR], Part 10, and Section 3503 of the California Fish and Game Code), which makes it illegal to take any migratory bird, nests, or eggs of such a bird except under the terms of a valid federal permit. The proposed project would avoid impacts to migratory birds during construction activities by limiting such activities to outside of the nesting season and/or by conducting nesting bird surveys prior to any tree removal. The adopted LUE also encourages the establishment of wildlife movement corridors between urban areas, wetlands, and the San Gabriel and Los Angeles Rivers (LU Policy 20-7 and LU Policy 21-5). LU Policy 20-12 also requires future projects to comply

with Chapter 14.28 of the Long Beach Municipal Code to ensure consistency with the City's tree preservation policy.

The adopted UDE does not address land use changes, and therefore, would not impact biological resources. Rather, the UDE outlines goals and strategies that would guide the aesthetic character of new development within PlaceTypes in the LUE.

There is no adopted Habitat Conservation Plan (HCP), Natural Communities Conservation Plan (NCCP), or other local or regional conservation plan covering the planning area. As such, implementation of the proposed project would not result in impacts to an adopted HCP/NCCP. The proposed project does not include land use changes within the California Coastal Zone, which is regulated by the California Coastal Act (Coastal Act). For the reasons outlined above, impacts with respect to biological resources are not evaluated further for the proposed project.

5.5 CULTURAL AND TRIBAL CULTURAL RESOURCES

Based on the Initial Study for the 2019 General Plan PEIR (Appendix A in the 2019 General Plan PEIR), all significance thresholds for cultural and tribal cultural resources were identified as having less than significant or no impacts.

The adopted LUE and UDE include a number of goals and policies aimed at preserving and maintaining the integrity of existing historic resources located throughout the planning area. Specifically, the adopted UDE includes strategies aimed at the preservation of the aesthetic character of existing historic resources (UD Strategy No. 9, Policy UD 2-1, Policy UD 9-1, Policy UD 9-2, Policy UD 9-3, Policy UD 10-1, Policy UD 10-3, Policy UD 19-4, and Policy UD 20-5), while the adopted LUE aims to preserve existing historic structures and neighborhoods throughout the City (LU Goal No. 4, Strategy No. 3, LU-M-3, and LU-M-43). Historic resources are further protected through regulation via the City's General Plan Historic Preservation Element (2010) and the City's Cultural Heritage Ordinance, which are contemplated and recognized in the LUE and UDE; the proposed project is consistent with these documents and does not modify either of them.

The adopted LUE also aims to minimize potential impacts to unknown archaeological resources, tribal cultural resources, and buried human remains through compliance with applicable federal, State, and local guidelines (as required by LU Policy 20-12). However, Native American consultation under Assembly Bill (AB) 52 would only be required for any CEQA project that has a notice of preparation, a notice of negative declaration, or a mitigated negative declaration filed on or after July 1, 2015. Therefore, the proposed project would not be subject to AB 52. Projects requiring a General Plan or Specific Plan Amendment would also be required to conduct Native American consultation in compliance with Senate Bill (SB) 18. However, since the proposed project does not require a General Plan or Specific Plan Amendment, the project would not be subject to SB 18.

The site is not located within a City-designated landmark historic district. The majority of the site is presently used as an outdoor pipe storage yard and is developed with a 5,827-sqaure-foot industrial building. The site was previously developed with structures, according to building permit records, prior to use as the outdoor pipe storage yard. A Cultural Resources Assessment (Appendix D) was completed for the project site. As a result of this assessment, the historic-period building to remain is not recommended eligible for the California Register or as a City Landmark (Long Beach Municipal Code Chapter 2.63.050). As such this resource is not recommended a "historical resource" under CEQA. It does not warrant further consideration. No other cultural resources were identified within the project site boundaries. Furthermore, previous construction-related excavation on the project site and disturbances from the channelizing of the Los Angeles River have disturbed sediments beyond depths at which buried prehistoric cultural resources are likely.

According to the paleontological resources assessment included in Appendix D, the geologic units underlying this project are mapped entirely as alluvial deposits dating from the Holocene period. While Holocene alluvial units are considered to be of high preservation value, material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, if development requires any substantial depth of disturbance, the likelihood of reaching Pleistocene alluvial sediments would increase. There are no recorded localities within the project area or within a 1-mile radius. While the presence of any fossil material is unlikely, if excavation

activity disturbs deeper sediment dating to the earliest parts of the Holocene or Late Pleistocene periods, the material would be scientifically significant. Excavation activity associated with the development of the project area is unlikely to be paleontologically sensitive, but caution during development should be observed.

The result of any Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was negative.

The proposed project would improve an underutilized parcel with a new industrial development that is consistent with UDE strategies and policies that ensure the proposed project preserves and respects the aesthetic character of the NI PlaceType and IG Zoning District.

Compliance with policies in the adopted LUE would ensure that the proposed project would not result in impacts to cultural or tribal cultural resources. Therefore, impacts with respect to cultural or tribal cultural resources are not evaluated further for the proposed project.

5.6 GEOLOGY AND SOILS

Based on the Initial Study for the 2019 General Plan PEIR (Appendix A in the 2019 General Plan PEIR), all significance thresholds for geology and soils were identified as having less than significant or no impacts.

The proposed project is an example of an infill site that was previously developed and would be redeveloped under the proposed project. A Geotechnical Investigation (Appendix E) was completed for the project site, which included field investigations, laboratory tests, settlement estimates and grading recommendations. The portion of the project site for reuse of the existing 5,287-square-foot industrial building would not include erection of a new structure, and would be limited to surface parking lot and landscape improvements. Based on existing soil conditions, construction methods and grading recommendations would be carried out in compliance with the building code recommendations.

Given the City's location in the seismically active area of Southern California, portions of the planning area are located within a Fault Zone, as designated by the California Department of Conservation (DOC) and United States Geological Survey (USGS). The proposed project would be required to comply with LU Policy 20-12, which requires compliance with current building codes to reduce potential impacts associated with seismic hazards. As such, implementation of the proposed project would not expose people or structures to substantial adverse effects related to the risk of loss, injury, or death involving the rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related failure (e.g., liquefaction or landslides).

LU Policy 20-12 also requires that future projects comply with Chapter 18.05 of the City's Municipal Code, which itself requires applicants to prepare a soils engineering report and/or geology report and comply with applicable geology and soils engineering recommendations prior to issuance of a grading permit. Compliance with the California Building Code currently in effect and preparation of site-specific geology and soils engineering studies would ensure that the proposed project would not result in impacts related to substantial soil erosion, unstable soils, expansive soils, or soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems. LU Policy 20-12 also aims to minimize potential impacts to unknown paleontological resources through compliance with applicable federal, State, and local guidelines. Therefore, impacts with respect to geology and soils are not evaluated further for the proposed project.

5.7 GLOBAL CLIMATE CHANGE

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:				
4.3.1	Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	Significant and Unavoidable Impact	☐	☒
4.3.2	Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	Less than Significant with Mitigation Incorporated	☐	☒

Impact Analysis

4.3.1 *Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?*

The 2019 PEIR found that future development associated with implementation of the 2019 PEIR would contribute to global climate change through direct and indirect emissions of greenhouse gases (GHGs) from land uses within the City. While the 2019 PEIR includes various policies that contribute to reduced GHG emissions, the City still requires assistance from additional federal and State programs and regulations to achieve the long-term GHG emissions goals and efficiency thresholds. The 2019 PEIR required implementation of Mitigation Measure MM GHG-1, which would reduce GHG emissions because it requires the preparation of a GHG Reduction Plan or a Climate Action and Adaptation Plan (CAAP) to ensure that the City continues on a trajectory that aligns with the short-term, interim, and long-term State GHG reduction goals. However, in addition to Mitigation Measure MM GHG-1, additional statewide measures are required in order to meet the service population threshold set by the CAAP. Because the performance of GHG reduction measures in the CAAP and compliance with future targets could not be assured, the 2019 PEIR determined that GHG emission impacts would remain significant and unavoidable.

The proposed project requires construction and operation of two new industrial buildings (62,042 square feet and 61,553 square feet, respectively) and the reuse of an existing 5,287-square-foot industrial building. Project construction and operation would involve generation of GHG emissions. The 2019 PEIR determined that GHG impacts would be significant and unavoidable, but through incorporation of mitigation measures, anticipated projects would fall within the scope of the 2019 PEIR analysis. However, Mitigation Measure MM GHG-1 is not applicable to the proposed project, as it is a program-level mitigation and not a project level mitigation and is specific to the adoption of the LUE/UDE. Although the Final CAAP has not been adopted at the time of this analysis, the proposed project would comply with the policies and provisions set forth in the Draft CAAP. According to the Draft CAAP, the 2030 efficiency target of 4.46 metric tons of carbon dioxide equivalent (MT CO₂e) per capita is based on the 2030 reduction targets established for the CAAP and is consistent with the State's target reductions of 40 percent below 1990 levels by 2030 and the

4.3.2 Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Similar to the LUE/UDE, the proposed project would be consistent with applicable measures and goals identified in the City's Sustainable City Action Plan, the CARB Scoping Plan, and SCAG's 2016–2040 RTP/SCS. The 2017 Scoping Plan Update reflects the 2030 target of a 40% reduction below 1990 levels, set by Executive Order B-30-15 and codified by SB 32. Table 3-11 of Appendix E summarizes the project's consistency with the 2017 Scoping Plan. As summarized, the Project will not conflict with any of the provisions of the Scoping Plan and supports seven of the action categories.

However, as previously specified, Mitigation Measure MM GHG-1 is not applicable to the proposed project, as implementation of the CAAP is specific to the adoption of the LUE/UDE and not an individual development project. Although the Final CAAP has not yet been adopted at the time of this analysis, the proposed project would comply with the policies and provisions set forth in the Draft CAAP, as further described in Table 3-12 of the Greenhouse Gas Analysis (Appendix F) for the project. Therefore, with compliance to the Draft CAAP, the proposed project would not conflict with or impede implementation of reduction goals identified in AB 32 and SB 32. The proposed project is also subject to all applicable regulatory requirements, which would reduce the GHG emissions of the proposed project. Therefore, since the proposed project is within the range of what was contemplated in the 2019 PEIR, no new potentially significant impact would occur, and further study of this issue is not warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

There are no applicable compliance measures or project design features from the 2019 PEIR related to global climate change, and no mitigation for subsequent projects was identified in the 2019 PEIR. Mitigation Measure MM GHG-1 is not applicable to the proposed project as implementation of the Climate Action and Adaptation Plan (CAAP) is specific to the adoption of the LUE/UDE and is not applicable to an individual development project.

~~**MM GHG 1** — The City of Long Beach (City) shall develop and adopt a greenhouse gas (GHG) Reduction Plan or Climate Action and Adaptation Plan (CAAP) to ensure that the City continues on a trajectory that aligns with the short-term, interim, and long-term State GHG reduction goals. Within approximately 36 months of adoption of the proposed General Plan Land Use Element (LUE)/Urban Design Element (UDE) project, the City of Long Beach shall prepare and present a CAAP to the City Council for adoption. The CAAP shall identify strategies to be implemented to reduce GHG emissions associated with the City. In addition, the City shall monitor GHG emissions by updating its community-wide GHG emissions inventory every 5 years upon adoption of the initial CAAP, which will include details on how the reduction programs will be implemented and will designate responsible parties to monitor progress and ensure implementation of the reductions within the CAAP. A monitoring and reporting program shall be included to ensure the CAAP achieves the reduction targets.~~

5.8 HAZARDS AND HAZARDOUS MATERIALS

Based on the Initial Study for the 2019 General Plan PEIR (Appendix A in the 2019 General Plan PEIR), all significance thresholds for hazards and hazardous materials were identified as having less than significant or no impacts. Hazardous materials are chemicals that could potentially cause harm during an accidental release or mishap, and are defined by the United States Department of Labor (2017) as being toxic, corrosive, flammable, reactive, an irritant, or strong sensitizer.² Hazardous substances include all chemicals regulated under the United States Department of Transportation “hazardous materials” regulations and the United States Environmental Protection Agency (USEPA) “hazardous waste” regulations. Hazardous wastes require special handling and disposal because of their potential to damage public health and the environment. The probable frequency and severity of consequences from the routine transport, use, or disposal of hazardous materials is affected by the type of substance, the quantity used or managed, and the nature of the activities and operations.

The adopted LUE allows for the intensification, redistribution, and development of currently undeveloped parcels with higher-density development. The proposed project consists of redevelopment of an outdoor pipe storage yard as two industrial warehouse buildings. Approval of the proposed project could include any physical improvements that could generate hazardous materials or create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. The proposed project would result in construction activities that would potentially use a limited amount of hazardous and flammable substances/oils (e.g., fuels, lubricants, and solvents) typical during heavy equipment operation. The amount and use of hazardous chemicals during future construction activities would be regulated by existing government rules and regulations, such as the Hazardous Materials Transportation Act, the Resource Conservation and Recovery Act, and the California Code of Regulations (CCR, Title 22).

The proposed project could result in long-term operational activities that would result in the use and storage of potentially hazardous materials. However, such materials would be required to be contained, stored, and used in accordance with manufacturers’ instructions and handled in compliance with applicable standards and regulations. In addition, the proposed project would be required to comply with LU Policy 20-12, which requires the preparation of predemolition surveys for asbestos-containing materials (ACMs), lead-based paints (LBPs), polychlorinated biphenyls (PCBs), and mold on properties where such materials have been identified and/or if there is a likelihood that these materials pose a hazard at the subject property. LU Policy 20-12 also requires preparation of a Contingency Plan that would outline procedures to be followed should unknown hazardous materials be encountered on the subject property during construction activities. Therefore, the proposed project would not create a significant hazard through the routine transport, use, or disposal of hazardous materials; create a significant hazard through reasonable foreseeable

² A “sensitizer” is a chemical that can cause a substantial proportion of people or animals to develop an allergic reaction in normal tissue after repeated exposure to a chemical. Source: United States Department of Labor. 2017. Appendix A to Sections 1910.1200—Health Hazard Criteria, Section A.4, Respiratory or Skin Sensitization. Website: <https://www.osha.gov/laws-regs/regulations/standard-number/1910/1910.1200AppA> (accessed March 9, 2021).

upset and accident conditions involving the release of hazardous materials; or be located on a hazardous materials site. Further, the proposed project would be required to evaluate the potential for the emission of hazardous materials within 0.25 mile of an existing or proposed school.

A Phase I Environmental Site Assessment Report (Appendix G) was prepared for the project, and recommended that a soil management plan (SMP) should be prepared for management of any debris and/or lead-impacted soil that may be encountered during planned re-development activities. The site reconnaissance did not identify any recognized environmental conditions (RECs) associated with the current outdoor pipe storage yard operations at the project site. A city-owned parcel with a lead-impacted soil stockpile covered with vegetation adjoins the northern portion of the project site immediately to the west and is considered a Business Environmental risk (BER). Some residual lead-impacted debris remains in place, including beneath the building, along the western property line, and beneath a Southern California Edison electrical pole. Since Long Beach Department of Human Health Services (DHHS) has issued a No Further Action (NFA) letter for the residual contamination in place, while left undisturbed it is considered a Controlled REC. In light of planned redevelopment activities that may disturb this soil during grading, however, it constitutes a REC.

LU Policy 20-12 also requires preparation of a Contingency Plan that would outline procedures to be followed should unknown hazardous materials be encountered on the subject property during construction activities. The operation of the proposed industrial project shall comply with all regulatory standards for any transport of incidental hazardous materials. Therefore, the proposed project would not create a significant hazard through the routine transport, use, or disposal of hazardous materials; would not create a significant hazard through reasonable foreseeable upset and accident conditions involving the release of hazardous materials; and would not be located on a hazardous materials site. Further, the proposed project would be required to evaluate the potential for the emission of hazardous materials within 0.25 mile of an existing or proposed school.

The proposed project would be required to comply with land use, noise, and height regulations outlined in the Airport Land Use Plan (ALUP) prepared for the Long Beach Airport and the Airport Environs Land Use Plan prepared for the Los Alamitos Joint Forces Training Base. The proposed project would not interfere with air traffic patterns, conflict with established Federal Aviation Administration (FAA) flight protection zones, conflict with building height standards established by the FAA for structures on and adjacent to the Long Beach Airport, or result in the exposure of people residing in the area to excessive airport noise.

The proposed project would be required to comply with policies set forth in the City's General Plan Public Safety Element (1975) related to emergency preparedness and evacuation procedures. The subject project site is not adjacent to wildlands and is not designated as being at risk for wildfires by the California Department of Forestry and Fire Protection (CAL FIRE). Therefore, implementation of the proposed project would not result in impacts related to emergency response activities or wildland fires.

For the reasons outlined above, impacts with respect to hazards and hazardous materials are not evaluated further for the proposed project.

The proposed project would be located in existing urban area and would not result in impacts associated with the alteration of a stream or river or in the addition of substantial amounts of impervious surfaces. The City is subject to the requirements of the *Waste Discharge Requirements for Municipal Separate Storm Sewer System Discharges from the City of Long Beach* (City of Long Beach MS4 Permit), Order No. R4-2014-0024, NPDES No. CAS004003. The proposed project is

classified as a New Development or Redevelopment Project as specified in the City of Long Beach MS4 Permit, and therefore is required to submit a Standard Urban Storm Water Mitigation Plan (SUSMP) and a Low Impact Development (LID) Plan (pursuant to LU Policy 20-12). Projects classified as New Development or Redevelopment Projects would be required to submit SUSMPs and LID Plans based on final approved plans. These plans would identify BMPs to be implemented during operation to control stormwater pollutants and runoff to minimize impacts related to the violation of water quality standards or waste discharge requirements and related to the alteration of existing drainage patterns. Further, operational BMPs would be implemented where treatment BMPs likely currently do not exist, which would improve stormwater quality discharges from those sites. Therefore, implementation of the proposed project would not result in impacts associated with the violation of water quality standards and/or waste discharge requirements or with the alteration of a stream or river or drainage patterns.

As stated above, groundwater supply for the City is considered to be very reliable, even during multi-year droughts because extractions are strictly limited and because multiple forms of replenishment exist. The proposed project would increase impervious surface areas in a manner that would substantially decrease infiltration, result in the substantial depletion of groundwater supplies, or interfere with groundwater recharge. New landscape areas and site infrastructure improvements would ensure compliance with regulatory standards in comparison to the existing outdoor pipe storage yard.

According to Figure LU-1 in the adopted LUE, most of the City is located in areas that are not within Federal Emergency Management Agency (FEMA) 100-year flood zones, with the exception of areas near the Port of Long Beach, Downtown, and Naples Island. As such, the adopted LUE includes LU Policy 20-12, which requires future applicants to obtain development permits from the City's Floodplain Administrator for projects proposed in FEMA special flood hazard areas to minimize flooding impacts to people and structures.

According to the City's Seismic Safety Element (1988) and the California Emergency Management Agency (Cal EMA), the majority of the City is not located within a zone of seiche areas. Similarly, the majority of the City is located outside of the Tsunami Inundation Zone, with the exception of the Port of Long Beach and in areas along the coastline and Los Angeles and San Gabriel Rivers. However, in the event of a tsunami, the City has established response procedures as described in the City of Long Beach Natural Hazards Mitigation Plan.

For the reasons outlined above, impacts with respect to hydrology and water quality are not evaluated further for the proposed project.

5.10 LAND USE AND PLANNING

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:				
4.4.2	Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	Less than Significant Impact	☐	☒

The Initial Study prepared for the 2019 PEIR determined that implementation of the LUE and UDE would result in less than significant impacts related to the division of an established community (Threshold 4.4.1). Therefore, impacts with respect to this threshold are not evaluated further for the proposed project.

Impact Analysis

4.4.2 Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

As described in the 2019 PEIR, development of future projects under the LUE/UDE are subject to consistency with the California Coastal Act, the Local Coastal Program (LCP), the SCAG 2008 Regional Comprehensive Plan (RCP), the SCAG RTP/SCS, the City's General Plan, the Port Master Plan (PMP), the Airport Land Use Plan (ALUP), and any applicable specific plans. The proposed project does not include any development or changes to land uses within the City's Coastal Zone and, therefore, the proposed project would be consistent with applicable goals and policies outlined in the Coastal Act. The adopted LUE/UDE includes Project Design Feature PDF 4.4.1, which mandates a Zone Change Program and LCP update to ensure that changes facilitated by the adopted LUE were consistent with the Zoning Code and the LCP.

The proposed project would be consistent with the current IG Zoning District as well as the flexibility of uses and development standards envisioned in the NI PlaceType within the approved LUE. As such, no zone change would be required as part of this project. Impacts related to consistency with the SCAG 2008 RTP and SCAG RTP/SCS would be similar to those analyzed in the 2019 PEIR, and would remain less than significant. In addition, the proposed project would not conflict with an adopted specific plan, the PMP, or the ALUP. The proposed project is consistent with the Land Use PlaceType identified for the project site in the 2019 PEIR; therefore, the proposed project's impact related to land use and planning is included within the 2019 PEIR analysis of the LUE/UDE. Therefore, the proposed project would not conflict with the City's Zoning Code. As the proposed project is consistent with the goals and provisions of the adopted LUE/UDE, no new potentially significant impact would occur. Further study of this issue is not warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

There are no applicable compliance measures for this project from the 2019 PEIR related to land use and planning. No mitigation for subsequent projects was identified in the 2019 PEIR. Project Design Feature PDF 4.4.1 is not applicable to the proposed project as implementation of the Zone Change Program and Local Coastal Program (LCP) update is specific to the adoption of the LUE/UDE and is not the responsibility of any individual development project.

~~**PDF 4.4.1** — To ensure that the proposed project complies with and would not conflict with or impede the City of Long Beach (City) Zoning Code, the proposed project shall implement a Zone Change Program and Local Coastal Program (LCP) update to ensure that changes facilitated by the adopted Land Use Element (LUE) are consistent with the Zoning Code and LCP. The Zone Change Program and LCP update shall be implemented to the satisfaction of the City Director of Development Services, or designee, and shall include the following specific performance criteria to be implemented within 5 years from the date of project approval:~~

- ~~• **Year 1:** Within the first 12 months following project approval, all Land Use Element/Zoning Code/LCP inconsistencies shall be identified and mapped. The City shall evaluate these inconsistencies and prioritize areas needing intervention.~~
- ~~• **Year 2:** Following the identification and mapping of any zoning and LCP inconsistencies, the City shall, within 24 months following project approval, begin processing zone changes, zone text amendments, and LCP updates in batches, as required to ensure that the Zoning Code and LCP are consistent with the adopted LUE.~~
- ~~• **Year 3:** The City shall, within 36 months following project approval, begin drafting new zones, or begin preparation of a comprehensive Zoning Code and LCP update, to better reflect the PlaceTypes identified in the adopted LUE.~~
- ~~• **Year 5:** All zoning and LCP inconsistencies shall be resolved through mapping and text amendments by the end of the fifth year following project approval. The City shall also submit the updated LCP to the California Coastal Commission (CCC) for consideration and approval by the end of the fifth year following project approval.~~

5.11 MINERAL RESOURCES

Based on the Initial Study for the 2019 General Plan PEIR (Appendix A in the 2019 General Plan PEIR), all significance thresholds for mineral resources were identified as having no impact.

The proposed project is an example of an infill site that is already developed and would be redeveloped under the proposed project. The project site is not currently used for oil or natural gas extraction.

According to the City's General Plan Conservation Element (1973), the mineral resources within the City have historically consisted of oil and natural gas. However, over the last century, oil and natural gas extractions have diminished as the resources have become increasingly depleted. Although extraction operations continue, they are on a reduced scale as compared to past historic levels. The proposed project does not include any physical improvements that would result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State. For these reasons, project-related impacts with respect to mineral resources are not evaluated further for the proposed project.

5.12 NOISE

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:				
4.5.1	Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Significant and Unavoidable Impact	☐	☒
4.5.2	Generate excessive groundborne vibration or groundborne noise levels?	Less than Significant Impact with Mitigation	☐	☒
4.5.3	For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels?	No Impact	☐	☒

Impact Analysis

4.5.1 *Would the project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?*

As described in the 2019 PEIR, construction activities associated with development anticipated under the LUE/UDE would be subject to compliance with the City's Noise Ordinance to ensure that noise impacts from construction sources are reduced. Some projects may have unusual or extremely loud construction activities (e.g., pile driving, nighttime construction work, or unusually long construction duration, etc.). Therefore, construction projects may result in a substantial increase in ambient noise levels, and mitigation would be required. Mitigation Measure MM NOI-1 would require future construction projects to implement construction best management practices to reduce potential construction-period noise impacts for nearby sensitive receptors. Although Mitigation Measure MM NOI-1 would reduce construction noise associated with future projects because the location, the proximity to sensitive receptors, and the type of construction equipment associated with new construction projects were unknown at the time the 2019 PEIR was drafted, construction noise impacts were considered significant and unavoidable in the 2019 PEIR.

A Noise Impact Analysis (Appendix H) was prepared for the project. To assess the existing noise level environment, 24-hour noise level measurements were taken at four locations in the project study area. The receiver locations were selected to describe and document the existing noise environment within the project study area. In addition, to assess the potential for long-term operational and short-term construction noise impacts, four sensitive receiver locations, as shown on Exhibit 6-A in Appendix H, were identified as representative locations for analysis.

The on-site Project-related noise sources are expected to include: loading dock activity, truck movements, roof-top air conditioning units, parking lot vehicle movements, and trash enclosure activity. This noise analysis is intended to describe the noise level impacts associated with the expected typical operational activities at the project site. As indicated on Tables 7-6 and 7-7 in Appendix H, the project will generate daytime and nighttime operational noise level increases ranging from 0.0 to 0.2 dBA L_{eq} at the nearby receiver locations. Therefore, the incremental project operational noise level increase is considered less than significant at all receiver locations.

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers, and portable generators that when combined can reach high levels. The number and mix of construction equipment are expected to occur in the following stages: Demolition, Site Preparation, Grading, Building Construction, Paving, and Architectural Coating. The construction noise analysis shows that the nearest receiver locations will satisfy the reasonable daytime 80 dBA L_{eq} significance threshold during project construction activities as shown on Table 8-3 in Appendix H. Therefore, the noise impacts due to project construction noise is considered less than significant at all receiver locations.

The proposed project is consistent with the Land Use PlaceType identified for the project site in the 2019 PEIR; therefore, the proposed project's impact related to noise is within the range of what was contemplated in the 2019 PEIR analysis of the LUE/UDE. With incorporation of Mitigation Measure MM NOI-1, construction and operation of the proposed project would not substantially increase the severity of ambient noise levels beyond those identified in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. Therefore, no further study of this issue is warranted.

4.5.2 Would the project generate excessive groundborne vibration or groundborne noise levels?

As discussed in the 2019 PEIR, implementation of the LUE/UDE included policies and strategies that protect sensitive receptors from vibration in excess of acceptable levels. Therefore, with implementation of Mitigation Measure MM NOI-1, the 2019 PEIR determined that the LUE/UDE would result in less than significant impacts related to the exposure of persons to excessive groundborne vibration and/or ground-borne noise levels.

The Noise Impact Analysis (Appendix H) estimates the potential vibration impacts during construction of the project. Table 8-5 in Appendix H presents the expected Project related vibration levels at the nearby receiver locations. At distances ranging from 936 to 1,613 feet from project construction activities, construction vibration velocity levels are estimated to be 0.000 in/sec PPV. Based on maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec) for older residential buildings, the typical Project construction vibration levels will satisfy the building damage thresholds at all receiver locations. Therefore, the vibration impacts due to project construction noise is considered less than significant at all receiver locations.

The proposed project is consistent with the Land Use PlaceType identified for the project site in the 2019 PEIR; therefore, the proposed project's impact related to vibration is within the range of what was contemplated within the 2019 PEIR analysis of the LUE/UDE. With incorporation of Mitigation Measure MM NOI-1, the proposed project would not generate any new operational vibration or

groundborne noise conditions not anticipated in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. Therefore, no further study of this issue is warranted.

4.5.3 *For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?*

As described in the 2019 PEIR, aircraft noise in the City is primarily related to aircraft operations at Long Beach Airport, Los Angeles International Airport, and John Wayne Airport. Long Beach Airport is located centrally within the City, approximately 3 miles northeast of downtown. As stated in Section 16.43.050 of the Municipal Code, it is the goal of the City that incompatible property in the vicinity of the airport shall not be exposed to noise levels above 65 dBA CNEL. Implementation of the LUE and UDE would locate business parks and airport-related land uses surrounding the airport and would not introduce any new noise-sensitive receptors within the 65 dBA noise contour. Therefore, the 2019 PEIR determined that the LUE/UDE would not result in the exposure of sensitive receptors to excessive noise levels from aircraft noise sources, and no mitigation was required.

Implementation of the proposed project would not change the location of business parks and airport related land uses surrounding the airport and would not introduce any new noise-sensitive receptors within the 65 dBA noise contour. Therefore, similar to the LUE/UDE, the proposed project would not result in the exposure of sensitive receptors to excessive noise levels from aircraft noise sources, and no new potentially significant impact would occur. Further study of this issue is not warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

The proposed project is designed in compliance with applicable LUE and UDE Goals, Strategies, and Policies, which are intended to reduce noise and vibration impacts of future development envisioned under the 2019 PEIR including this project. In addition, the proposed project would be subject to compliance with the City's Noise Ordinance. The 2019 PEIR did not include compliance measures or project design features related to noise.

Mitigation Measure MM NOI-1 is applicable to the proposed project and would be required to ensure project impacts related to noise are less than significant.

MM NOI-1 Project contractors shall implement the following construction best management practices during construction activities:

- Schedule high-noise and vibration-producing activities to a shorter window of time during the day outside early morning hours to minimize disruption to sensitive uses.
- Grading and construction contractors shall use equipment that generates lower noise and vibration levels, such as rubber-tired equipment rather than metal-tracked equipment.

- Construction haul trucks and materials delivery traffic shall avoid residential areas whenever feasible.
- The construction contractor shall place noise- and vibration-generating construction equipment and locate construction staging areas away from sensitive uses whenever feasible.
- Locate equipment staging in areas that would create the greatest possible distance between construction-related noise sources and noise-sensitive receptors nearest the active project site during all project construction.
- Prohibit extended idling time of internal combustion engines.
- Ensure that all general construction-related activities are restricted to 7:00 a.m. and 7:00 p.m. on weekdays and federal holidays, and between 9:00 a.m. and 6:00 p.m. on Saturdays. No construction would be permitted on Sundays. Construction activities occurring outside of these hours may be permitted with authorization by the Building Official and/or permit issued by the Noise Control Officer.
- All residential units located within 500 feet of a construction site shall be sent a notice regarding the construction schedule. A sign legible at a distance of 50 feet shall also be posted at the construction site. All notices and the signs shall indicate the dates and durations of construction activities, as well as provide a telephone number for a “noise disturbance coordinator.”
- A “noise disturbance coordinator” shall be established. The disturbance coordinator shall be responsible for responding to any local complaints about construction noise. The disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early or bad muffler, etc.) and shall be required to implement reasonable measures to reduce noise levels.
- For all projects determined to have unusual or extremely loud construction activities (e.g., pile driving, nighttime construction work, or unusually long construction duration, etc.) that would generate noise levels over 90 dBA L_{eq} at nearby sensitive receptors, temporary noise control blanket barriers shall be installed in a manner to shield sensitive receptors land uses.

5.13 POPULATION AND HOUSING

	2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:			
4.6.1 Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	Less than Significant Impact	☐	☒

The Initial Study prepared for the 2019 PEIR determined that impacts related to displacement of people or housing (Threshold 4.6.2) would be less than significant because there would be no physical improvements that would displace substantial numbers of existing housing or people. Therefore, impacts with respect to this threshold are not evaluated further for the proposed project.

Impact Analysis

4.6.1 Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The 2019 PEIR found that implementation of the LUE/UDE would allow for an increase in population, employment, and housing in the City of Long Beach through horizon year 2040. With the exception of housing, this increase would be consistent with SCAG's regional growth forecasts for each of these areas for the same horizon year. However, much of the increase in housing units was expected to accommodate existing residents due to a combination of aging in place and overcrowded housing conditions, as identified in the Assessment of Fair Housing (AFH) report. Therefore, the 2019 PEIR determined that the LUE/UDE's growth-inducing potential would be less than significant, as it would not foster growth in excess of what is already anticipated in pertinent master plans, land use plans, or in projections made by regional planning agencies (e.g., SCAG). Further, because the LUE/UDE would facilitate an increase in non-residential uses, the 2019 PEIR concluded that the LUE/UDE would meet any increased demands for additional goods and services associated with the projected increase in population. In addition, under the LUE/UDE, improvements to public utilities, including new water, sanitary sewer, and storm water services would be identified on a project-specific basis as new developments are proposed. Infrastructure improvements associated with future development facilitated by the LUE/UDE would be sized appropriately for each project and would not be oversized to serve additional growth beyond that envisioned under the LUE. Therefore, the 2019 PEIR determined that the LUE/UDE would result in less than significant impacts with respect to the inducement of substantial unplanned population growth in an area, and no mitigation was required.

The proposed project involves the development of two new industrial warehouse buildings and the reuse of an existing 5,827-square-foot industrial building. The project would provide additional employment opportunities within the projected parameters of the 2019 PEIR. The proposed project

would not foster growth in excess of what is already anticipated in pertinent master plans, land use plans, or in projections made by regional planning agencies (e.g., SCAG). The project does not include residences and, therefore, would not directly cause population growth. The project would create jobs that could indirectly cause population growth through employees that may relocate to the area. However, it is anticipated that employees would mainly come from the local existing labor workforce and generally would not relocate to the City of Long Beach. Therefore, the proposed project would not cause a substantial increase in population nor induce unplanned population growth.

Further, although the proposed project would facilitate an increase in employment and potential residents in the nearby area, the 2019 PEIR concluded that the LUE/UDE would meet any increased demands for additional goods and services associated with the projected increase in population. Infrastructure improvements associated with the proposed project would be sized appropriately and would not be oversized to serve additional growth beyond that envisioned under the adopted LUE/UDE. The proposed project is consistent with the Land Use PlaceType identified for the project site in the 2019 PEIR; therefore, the proposed project's impact related to population and housing is within the range of what was contemplated within the 2019 PEIR analysis of the LUE/UDE. Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

This project has been developed in adherence with the LUE and UDE Goals, Strategies, and Policies intended to reduce the impacts of future development envisioned under the 2019 PEIR. There are no applicable compliance measures or project design features related to population and housing from the 2019 PEIR to which this project must adhere. No mitigation for subsequent projects was identified in the 2019 PEIR.

5.14 PUBLIC SERVICES

	2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:			
Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:			
4.7.1 Fire protection?	Less than Significant Impact	☐	☒
4.7.2 Police protection?	Less than Significant Impact	☐	☒
4.7.3 Schools?	Less than Significant Impact	☐	☒
4.7.5 Other public facilities?	Less than Significant Impact	☐	☒

The Initial Study prepared for the 2019 PEIR determined that implementation of the LUE and UDE would result in less than significant impacts to parks (Threshold 4.7.4) because there would be no physical improvements that would result in substantial adverse physical impacts to parks. Therefore, impacts with respect to this threshold are not evaluated further for the proposed project.

Impact Analysis

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

4.7.1 Fire protection?

As described in the 2019 PEIR, as a result of increased growth accommodated by the LUE/UDE, overall demands for fire protection services and emergency services in the City would increase. Consequently, additional Long Beach Fire Department (LBFD) resources (including staffing) would be required to provide fire protection for new residents, workers, and structures. The City's costs to maintain facilities and equipment as well as train and equip personnel would also increase. The costs of additional personnel and materials were anticipated to be offset through the increased

revenues and fees, such as property taxes, generated by future development. Future projects would be reviewed by the City on a project-by-project basis and would be required to comply with any requirements in effect when the review was conducted. Prior to the issuance of building permits, future project applicants would be required to pay the adopted fire facilities impact fees. The Lbfd would also continue to be supported by Proposition H revenue; the City's General Funds; the City's Tidelands operation revenue; and other revenue sources. Therefore, the 2019 PEIR determined that sufficient revenue would be available for necessary improvements to provide for adequate fire facilities, equipment, and personnel upon the anticipated General Plan build out. Additionally, the proposed PlaceType designations permitted the future development and operation of new stations within PlaceTypes. The LUE/UDE permitted the development of new stations, proposed no physical improvements, and required all future projects to assess project impacts on fire protection services. Therefore, the 2019 PEIR determined that impacts would be less than significant, and no mitigation was required.

The proposed project includes the construction of two new industrial buildings and the reuse of an existing industrial building consistent with the General Plan NI PlaceType and is within the range of what was contemplated in the 2019 PEIR analysis for the LUE/UDE. The proposed project would not substantially increase the demand for fire protection. In addition, the project applicant would be required to pay adopted development impact fees to offset any additional demand. Therefore, the proposed project would not result in impacts beyond those previously identified in the 2019 PEIR and further study of this issue is not warranted.

4.7.2 Police protection?

As described in the 2019 PEIR, the LUE/UDE did not include any physical improvements, but allowed for future development that was anticipated to create an increase in the typical range of police service calls within the City. New and/or additional police resources would be needed to prevent an impact to service ratios as a result of future growth accommodated by the LUE/UDE. The City's costs to maintain facilities and equipment as well as train and equip personnel would also increase. The costs of additional personnel and materials were anticipated to be offset through the increased revenues and fees, such as property taxes, generated by future development. Future projects would be reviewed by the City on a project-by-project basis and would need to comply with any requirements in effect when the review is conducted. Prior to the issuance of building permits, future project applicants would be required to pay the adopted police facilities impact fees. Additional police personnel and resources would be provided through the annual budget review process. Furthermore, the Long Beach Police Department (LBPD) would continue to be supported by Proposition H revenue, a per barrel tax on all oil producers in Long Beach; the City's Tidelands operation revenue; and other revenue sources. By following this process, sufficient revenue would be available for necessary service improvements to provide for adequate police facilities, equipment, and personnel under the anticipated General Plan build out. Therefore, the 2019 PEIR determined that impacts would be less than significant, and no mitigation was required.

The proposed project includes the construction of two new industrial buildings and the reuse of an existing industrial building consistent with the General Plan NI PlaceType and is within the range of what was contemplated in the 2019 PEIR analysis for the LUE/UDE. The proposed project would not

substantially increase the demands for police protection services. In addition, the project applicant would be required to pay adopted development impact fees to offset any additional demand. The proposed project would not result in a new impact beyond those previously identified in the 2019 PEIR and further study of this issue is not warranted.

4.7.3 Schools?

As described in the 2019 PEIR, implementation of the LUE/UDE allowed for the future development of up to 28,524 dwelling units by 2040, which would result in the generation of additional school-age children within the Long Beach Unified School District (LBUSD) service area. Of the 28,524 units, the City had identified a need for 21,476 housing units to address existing housing needs attributed to overcrowding. As such, the majority of the 28,524 anticipated new housing units would relieve overcrowding of existing households in the City, so those families were already being served by LBUSD. Still, the 2019 PEIR determined that this potential future growth had the potential to strain existing and/or planned school facilities.

Based on student generation factors and projected growth in the City, the 2019 PEIR determined that the anticipated General Plan build out was expected to result in an increase of 5,272 students. With the anticipated General Plan build out, elementary and middle school enrollment in LBUSD was expected to be within the 2017–2018 LBUSD facilities' capacity, but the total estimated enrollment for high schools in 2040 had the potential to exceed the LBUSD current facilities' capacity. All future development projects in the City would be required to pay school developer fees to LBUSD for the operation, maintenance, and development of schools to accommodate future student enrollment. If student growth generated by the anticipated General Plan build out exceeded the estimates identified above, the acquisition, modernization, or modification of school sites to accommodate additional facilities would be required. Additional school resources would also continue to be funded by an increase in tax revenue as a result of future growth. In addition, new housing units would be built over the course of 21 years, during which enrollment rates would likely fluctuate. Therefore, the 2019 PEIR determined that impacts of the LUE/UDE related to student generation and the potential need for additional school facilities would be less than significant, and no mitigation was required.

The proposed project does not include additional residences that would substantially increase the local population and necessitate new schools. Because the proposed project would not generate additional students in the LBUSD or directly affect any schools, no impact would occur.

As required by the 2019 PEIR, the applicable projects would be required to pay school developer fees to LBUSD for the operation, maintenance, and development of schools to accommodate future enrollment. The proposed project is consistent with the General Plan NI PlaceType and is within the range of what was contemplated in the 2019 PEIR analysis for the LUE/UDE. Therefore, with payment of the associated school developer fees, the proposed project would not result in a new impact related to schools that was not previously identified in the 2019 PEIR, and further study of this issue is not warranted.

4.7.5 *Other public facilities?*

As described in the 2019 PEIR, the LUE/UDE introduced PlaceTypes that would facilitate an increase in housing units in the City and could increase the demand for library facilities. Demand for library services is typically determined based on the size of the resident population. Because the City has not formally adopted a service standard of library space per capita, the 2019 PEIR utilized the target of 0.45 sf per capita established in the City's budget for Fiscal Year 2007. Using this standard and the estimated future population of approximately 484,485, the 2019 PEIR determined that the Long Beach Public Library (LBPL) system would need to contain a total of 218,0195 sf to meet this target. In total, the existing LBPL system had approximately 237,695 sf of library facilities, which was greater than the City's threshold for providing library services for both the existing population and the projected demand generated by the anticipated build out of the General Plan. In addition, the 2019 PEIR took into account that technology continues to evolve as does residential demand for electronic library services and resources. With the increased demand for electronic resources, the 2019 PEIR determined that it may be valuable to measure library services by more than a square footage per capita benchmark. Although the new library at the City's Civic Center was smaller in square footage than the original library, the new library makes more efficient use of its space. Therefore, the loss of library square footage was not considered a loss of library volumes or available resources to serve the existing and projected population in the City. It was anticipated that the demand for electronic materials will continue to increase, potentially reducing the amount of square footage to service library patrons. Therefore, the 2019 PEIR determined that the LUE/UDE's increase in demand on library services can be served by the existing facilities and would not adversely affect library services in the City. As such, the LUE/UDE was determined to have less than significant impacts related to public libraries, and no mitigation was required.

The proposed project does not include additional residences that would substantially increase the usage of existing government facilities in the City, such as libraries. As described in the 2019 PEIR, although certain projects would increase demand on library services, existing facilities would be able to accommodate this increase in demand, and no adverse effects to library services in the City would occur. The proposed project is consistent with the General Plan NI PlaceType and is within the range of what was contemplated in the 2019 PEIR analysis for the LUE/UDE. The proposed project would not create a new impact related to public libraries that was not previously identified in the 2019 PEIR, and further study of this issue is not warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

This project has been developed in adherence with the LUE and UDE Goals, Strategies, and Policies intended to reduce the impacts of future development envisioned under the 2019 PEIR.

There are no applicable compliance measures or project design features related to public services from the 2019 PEIR to which this project must adhere. No mitigation for subsequent projects was identified in the 2019 PEIR.

5.15 RECREATION

Based on the Initial Study for the 2019 General Plan PEIR (Appendix A in the 2019 General Plan PEIR), all significance thresholds for recreation were identified as having less than significant impacts. According to the adopted LUE, the planning area currently contains 100 public parks with 25 community centers, 2 tennis centers, 5 municipal golf courses, and a marina system. Overall, the citywide total for recreation uses is approximately 2,750 acres. Furthermore, the adopted LUE established the Open Space PlaceType to preserve existing parks and recreational facilities, while also creating additional parks and urban open spaces to increase connectivity between these resources and surrounding neighborhoods. In addition, one of the primary goals of the adopted LUE is to “create, restore, and preserve open space” uses in the City, including parks and recreation uses. For example, LU Policy 18-7 calls for prioritizing the location of new parks in underserved or low-income communities with the lowest ratio of park space per thousand residents. The City will continue to pursue open space goals and a policy as set forth in the City’s General Plan Open Space and Recreation Element (2002), which itself is consistent with the LUE and the UDE.

The proposed project is an example of an infill site that is already developed and would be redeveloped under the proposed project. Implementation of the proposed project is within the range of what was contemplated in the 2019 PEIR and therefore would not result in significant impacts related to increased use and deterioration of recreational facilities, nor would it include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. As discussed above, Population and Housing, the project would not generate a direct increase in population growth on the project site; therefore, the proposed project would not directly affect any existing parks or increase demand for parks. Because the project would involve warehouse/manufacturing development that would not provide any recreational facilities on-site or generate demand for recreational facilities, no adverse impact related recreation would occur. The proposed project would not result in a new impact related to parks that was not previously identified in the 2019 PEIR, and impacts with respect to recreation are not evaluated further for the proposed project.

Implementation of the proposed project is within the range of what was contemplated in the 2019 PEIR, and therefore, would not result in significant impacts related to increased use and deterioration of recreational facilities, nor would it include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. Therefore, impacts with respect to recreation are not evaluated further for the proposed project.

5.16 TRANSPORTATION

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:				
4.8.1	Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	Significant and Unavoidable Impact	☐	☒
4.8.2	Conflict or be inconsistent with CEQA Guidelines §15064.3, subdivision (b)?	Less than Significant Impact	☐	☒

The Initial Study prepared for the 2019 PEIR determined that that implementation of the LUE and UDE would result in less than significant impacts related to changes in the exposure to hazards due to a design feature (Threshold 4.8.3) and inadequate emergency access (Threshold 4.8.4). Therefore, impacts with respect to these thresholds are not evaluated further for the proposed project.

Impact Analysis

4.8.1 *Would the project conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?*

As described in the 2019 PEIR, the Traffic Impact Analysis (TIA) determined that 48 intersections could be significantly impacted by implementation of future development projects in the anticipated 2040 General Plan build out scenario based on the City's criteria. Potentially significant traffic impacts were also identified at freeway facilities. Although physical improvements that would retain the performance goal of level of service (LOS) D were identified, all of the physical improvements necessary for impacted intersections to function at LOS D are subject to constraints that render the addition of vehicle capacity infeasible. The City's Capital Improvement Program, Mobility Element (2013), and/or applicable specific plans were also reviewed for pending and planned vehicle and nonvehicle capacity improvements throughout the City. As such, applicants for future discretionary projects above a certain threshold would be required to comply with Mitigation Measure MM T-1. Mitigation Measure MM T-1 requires applicants for future projects to prepare a traffic improvement analysis to identify feasible physical improvements to reduce impacts at specified intersections within the planning area. While recommended improvements and implementation of Mitigation Measure MM T-1 could contribute to a reduced vehicle LOS, the effectiveness of these improvements was not able to be quantified at the time of preparation of the 2019 PEIR, as future specific projects had not been identified; therefore, these improvements were not considered as mitigation for the 48 impacted study area intersections for the purposes of CEQA. Therefore, impacts to the 48 intersections were considered significant and unavoidable for horizon year 2040 in the 2019 PEIR.

In addition to identifying significant and unavoidable impacts at the 48 impacted intersections based on the City's criteria, the TIA also identified significant impacts at 4 of the 10 monitored intersections within the study area based on Los Angeles County's 2010 Congestion Management Program (CMP) criteria. Despite recommended improvements in Mitigation Measure MM T-1, potentially significant impacts to California Department of Transportation (Caltrans) intersections and freeway facilities may remain significant and unavoidable. Therefore, the impacts to these intersections were considered significant and unavoidable for horizon year 2040 in the 2019 PEIR.

As demonstrated in the Trip Generation Assessment (Appendix I) prepared for the proposed project, the proposed project would generate, as shown on Table 3, the proposed project is anticipated to generate 416 two-way trips per day with 53 AM peak hour trips and 50 PM peak hour trips. Consistent with the City's *Traffic Impact Analysis Guidelines* (June 2020), a passenger car equivalent (PCE) factor of 2.0 has been applied to the heavy trucks. The proposed project is anticipated to generate 468 two-way PCE trips per day with 56 PCE AM peak hour trips and 53 PCE PM peak hour trips. Table 4 in Appendix I shows the trip generation comparison and the resulting net change in trips between the currently adopted General Plan land use and the proposed project. In an effort to conduct a conservative comparison, the trip generation based on PCE has been utilized for the proposed project. The proposed project would result in 270 fewer two-way trips per day and a net reduction of 43 AM peak hour trips and 35 PM peak hour trips (in PCE). The development of the proposed project is anticipated to generate fewer than 50 new peak hour trips (in PCE) and fewer than 500 net new two-way trips per day in comparison to the currently adopted General Plan land use. Based on the City's TIA Guidelines, additional traffic operations analysis is not necessary.

The trip generation analysis conducted for the project found that the proposed project is screened out from further Vehicle Miles Traveled (VMT) analysis and is deemed to have no significant transportation impacts because it meets one of the adopted screening criteria, which is that the project as proposed is a low trip generator. Because, the project is both consistent with the adopted General Plan and generates total daily trips and peak hour trips that are below the thresholds in the City's adopted VMT guidelines (fewer than 50 peak hour trips or 500 average daily trips), the proposed project is expected to have a low VMT and no further transportation analysis is required. As the proposed project is anticipated to generate less trips than the currently adopted General Plan land use and the thresholds identified in the adopted *Traffic Impact Analysis Guidelines* (June 2020) would not be exceeded, Mitigation Measure MM T-1 is not applicable to the proposed project. Furthermore, no new impacts were identified in the Traffic Generation Assessment (Appendix I) that warranted additional mitigation. Implementation of the proposed project is not anticipated to conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

A Vehicle Miles Traveled Screening Analysis was completed for the proposed project (see Appendix J). The purpose of the VMT assessment is to evaluate the proposed project based on Senate Bill 743 (SB 743) requirements and the adopted City of Long Beach Traffic Impact Analysis Guidelines (June 2020) (City Guidelines). The following discussion is based on the VMT Screening Analysis.

The City Guidelines identifies that small projects that generate fewer than 500 ADT would generate GHG emissions below applicable thresholds and would therefore be considered less than significant. The trip generation rates used for this analysis are based on the Trip Generation Assessment (Appendix I) for the project. The Project is estimated to generate a total 416 vehicle trip ends per day, which is below the identified City threshold. Based on review of applicable VMT screening thresholds, the project was found to meet the low trip generator VMT screening criteria. The project would therefore be assumed to result in a less than significant VMT impact; no additional VMT analysis is required.

4.8.2 Would the project conflict or be inconsistent with CEQA Guidelines §15064.3, subdivision (b)?

As described in the 2019 PEIR, the 2016–2040 RTP/SCS provided calculations of VMT derived from the Regional Travel Demand Model. VMT per capita is anticipated to decline in the future as a result of previous planning efforts and is anticipated to decline further due to the elements of the 2016–2040 RTP/SCS. VMT per capita in Long Beach is lower in the existing condition than the region as a whole and in Los Angeles County.

With implementation of the 2016–2040 RTP/SCS, VMT per capita in Long Beach is anticipated to be lower than the region as a whole and in Los Angeles County. Similar to the trend shown in the 2016–2040 RTP/SCS, the 2019 PEIR determined that VMT in Long Beach is projected to decline as a result of planning efforts. In absolute terms, VMT in Long Beach was expected to be reduced from 9,482,252 per day in the existing condition to 9,028,327 with implementation of the LUE/UDE (a 5 percent decrease). The population was expected to increase as VMT declines, resulting in a decrease in VMT per capita per day from 19.9 to 18.2 (a 9 percent decrease).

The 2019 PEIR determined that land use changes proposed in the LUE/UDE would result in more efficient travel during the morning and evening peak commute hours (i.e., lower VMT during the peak periods). However, VMT during off-peak times was expected to increase slightly with the LUE/UDE as compared to the previous LUE. These off-peak VMT are generated by discretionary trips associated with the number of households in the City. Because implementation of the LUE/UDE reduces overcrowding compared to the previous land use distribution, the number of discretionary trips increases; similarly, the off-peak VMT increases, and subsequently, the total VMT as compared to the no project scenario increases. The existing VMT per household was 56.9 per day, which is anticipated to decline in the future to 49.9 per day without implementation of the LUE/UDE. The efficiency of the distribution of land uses in the LUE/UDE would reduce this further to 46.1 VMT per day per household (a 19 percent decrease from existing conditions).

The State of California has concurrent goals of reducing VMT and increasing housing supply to improve affordability and reduce overcrowding. Implementation of the LUE/UDE increases the number of housing units to reduce overcrowding in Long Beach. The efficiency of the location of land uses in the project (i.e., infill development policies and sites) results in a 19 percent decrease in VMT per household compared to the existing conditions. Other measures of VMT, including per capita and absolute terms, also decline compared to the existing conditions. With implementation of the LUE/UDE, VMT per capita in Long Beach remains lower than the region as a whole and lower than Los Angeles County. Because the measures of VMT in absolute terms and per capita decrease

from the existing conditions with the LUE/UDE and the measure of VMT per household decreases from existing conditions and from the current LUE, the 2019 PEIR determined that the LUE/UDE would have a less than significant impact related to State CEQA Guidelines Section 15064.3 subdivision (b), and no mitigation was required.

The proposed project, which would include construction of two industrial buildings and reuse of an existing industrial building, is within the range of development contemplated in the 2019 PEIR analysis for the LUE/UDE. A Vehicle Miles Traveled Screening Analysis was completed for the proposed project (see Appendix J). According to the Long Beach Traffic Analysis Guidelines, the proposed project would be screened from preparing a more detailed VMT analysis because it is a small project with fewer than 500 daily trips. Based on the substantial evidence presented in the City of Long Beach Traffic Impact Analysis Guidelines (June 2020), the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

This project has been developed in adherence with the LUE and UDE Goals, Strategies, and Policies intended to direct growth to areas served by transit and encourage compact pedestrian and bicycle-friendly development patterns and urban design. There are no compliance measures or project design features related to transportation and traffic from the 2019 PEIR that are applicable to the project.

Mitigation Measure T-1 is not applicable as the proposed project would generate less than 100 peak-hour trips as demonstrated in Appendix I.

~~**MM T 1** Prior to approval of any discretionary project that is forecast to generate 100 or more peak-hour trips, as determined by the City of Long Beach (City) Traffic Engineer, the property owners/developers shall prepare a traffic improvement analysis of any facilities under the jurisdiction of Caltrans at which the project is anticipated to contribute 50 or more peak-hour trips, analyzing the impact on such State transportation facilities where Caltrans has previously prepared a valid traffic study, as identified below, and identified feasible operational and physical improvements and has determined the associated fees necessary to mitigate project-related impacts. The fair share cost of such improvements shall be assessed if transportation analysis demonstrates such improvements can achieve vehicle level of service (LOS) D (as measured by Intersection Capacity Utilization or Highway Capacity Manual methodology) or an improved vehicle level of service, if LOS D cannot be feasibly achieved. The Conditions of Approval for the project shall require the property owner/developer to construct, bond for, or pay reasonable fair share fees to the City who will work jointly with Caltrans to implement such improvements, unless alternative funding sources have been identified.~~

~~In the event that Caltrans prepares a valid study, as defined below, that identifies fair share contribution funding sources attributable to and paid from private~~

~~development to supplement other regional and State funding sources necessary to undertake improvements of impacted State transportation facilities, then the project applicant shall use reasonable efforts to pay the applicable fair share amount to Caltrans. The study shall be reviewed and approved by the California Transportation Commission. It shall include fair share contributions related to private development based on nexus requirements contained in the Mitigation Fee Act (Govt. Code § 66000 et seq.) and 14 Cal. Code of Regs. § 15126.4(a)(4) and, to this end, the study shall recognize that impacts to Caltrans facilities that are not attributable to development located within the City of Long Beach are not required to pay in excess of such developments' fair share obligations. The fee study shall also be compliant with Government Code § 66001(g) and any other applicable provisions of law. If Caltrans chooses to accept the project Applicant's fair share payment, Caltrans shall apply the payment to the fee program adopted by Caltrans or agreed upon by the City and Caltrans as a result of the fair share fee study.~~

5.17 UTILITIES AND SERVICE SYSTEMS

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:				
4.9.1	Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	Less Than Significant Impact	☐	☒
4.9.2	Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	Less Than Significant Impact	☐	☒
4.9.3	Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	Less Than Significant Impact	☐	☒
4.9.4	Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	Less Than Significant Impact	☐	☒

The Initial Study prepared for the 2019 PEIR determined that implementation of the LUE and UDE would result in less than significant impacts related to compliance with federal, State, and local statutes and regulations related to solid wastes (Threshold 4.9.5). Therefore, impacts with respect to this threshold are not evaluated further for the proposed project.

Impact Analysis

4.9.1 Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Water

As discussed in the 2019 PEIR, future development projects facilitated by the LUE/UDE would result in an increased water demand. The project-related increase in water demand in 2040 was expected to be less than 1 percent of the Long Beach Water Department's (LBWD) total projected water supply for horizon year 2040. As such, water supplies were expected to be sufficient to meet all demands through horizon year 2040 during normal, single dry year, and multiple dry year hydrologic conditions. As noted in the 2019 PEIR, the project-related increase in demand for water may not be directly correlated with the increase in housing units since the majority of anticipated new units are needed to alleviate overcrowding of existing residences that were already using water. The future

development facilitated by the LUE/UDE would comply with water conservation measures, including pertinent provisions of the CALGreen Code building efficiency standards (Title 24, Part 11) regarding the use of water-efficient fixtures. Policies and programs outlined in the 2015 Urban Water Management Plan (2015 UWMP) and the approved LUE would reduce water consumption and wastewater flow during operation, which would decrease the overall burden on existing water facilities and decrease the number of facilities that would be needed to be constructed or expanded. Additionally, under AB 610, a Water Supply Assessment (WSA) would be required for certain projects. Individual projects occurring under the LUE/UDE would be required to prepare a WSA if they meet any of the requirements under AB 610. Because future development that may occur with implementation of the LUE/UDE was determined to be consistent with water demands in the 2015 UWMP and because the LBWD had identified a surplus water supply to provide the projected water demands through horizon year 2040, the future project-related demand for water was determined to be consistent with the City's UWMP. Therefore, the 2019 PEIR determined that the LUE/UDE would not result in the need for additional water infrastructure. Impacts were determined to be less than significant, and no mitigation was required.

As a project contemplated within the scope of the 2019 PEIR analysis for the LUE/UDE, water supplies under the proposed project are expected to be sufficient to meet all demands through horizon year 2040 during normal, single dry year, and multiple dry year hydrologic conditions. As noted in the 2019 PEIR, the project-related increase in demand for water may not be directly correlated with the increase in housing units since the majority of anticipated new units are needed to alleviate overcrowding of existing residences that were already using water. The proposed project would comply with water conservation measures, including pertinent provisions of the CALGreen Code building efficiency standards (Title 24, Part 11) regarding the use of water-efficient fixtures. Policies and programs outlined in the 2015 UWMP and the approved LUE would reduce water consumption and wastewater flow during operation, which would decrease the overall burden on existing water facilities and decrease the number of facilities that would be needed to be constructed or expanded. A WSA is only required for the development of proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area, and the proposed project does not exceed this threshold. Therefore, no WSA will be required for the proposed project. Because future development associated with implementation of the LUE/UDE is consistent with water demands in the 2015 UWMP, because the LBWD had identified a surplus water supply to provide the projected water demands through horizon year 2040, and because the project is consistent with future development contemplated under the 2019 PEIR, the future project-related demand for water is consistent with the City's UWMP. Therefore, the proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Wastewater

As described in the 2019 PEIR, short-term demand for wastewater treatment services may occur during construction activities associated with future projects facilitated by the LUE/UDE. Sanitary services during construction of future projects were expected to be provided by portable toilet

facilities, which would transport waste off site for treatment and disposal. The demand for wastewater treatment services during construction would be temporary and would generate minimal wastewater compared to the demand for wastewater treatment services associated with the anticipated General Plan build out scenario under the LUE/UDE. As described in the 2019 PEIR, following the anticipated General Plan build out, the wastewater flow generated under the LUE/UDE was estimated to be approximately 4 percent of the remaining capacity of existing Los Angeles County Sanitation District (LACSD) facilities. This projection was anticipated to be conservative and representative of a worst-case scenario because the majority of new housing units to be developed as part of the LUE/UDE were required to alleviate overcrowding of existing housing units for existing Long Beach residents who were already generating wastewater. In addition, as noted in the 2019 PEIR, new units are likely to use significantly less water and thereby generate less wastewater due to building codes requiring reduced water consumption and reduced landscaping associated with proposed multi-family residential units, which accounted for the majority of new residential development under the LUE/UDE. Therefore, the 2019 PEIR determined that the projected future increase in wastewater flows associated with development that may occur with implementation of the LUE/UDE would not exceed the treatment requirements of the Regional Water Quality Control Board (RWQCB) for the Joint Water Pollution Control Plant (JWPCP) and the Long Beach Water Reclamation Plant (WRP) of the LACSD. As discussed in the 2019 PEIR, future development projects facilitated by the LUE/UDE will be reviewed by the City on a project-by-project basis and will be required to comply with any requirements in effect when the review is conducted, including sewer capacity considerations as part of the City development review and approval process. Improvements and upgrades to sewer lines would continue to be prioritized based on need and would occur throughout the planning period under the LUE/UDE. As such, the 2019 PEIR determined that impacts related to wastewater treatment during construction and operation would be less than significant, and the LUE/UDE would not have necessitated the construction of wastewater supply or conveyance facilities. No mitigation was required.

Short-term demand for wastewater treatment services may occur during construction activities associated with the proposed project. However, sanitary services during construction of the proposed project are expected to be provided by portable toilet facilities, which would transport waste off site for treatment and disposal. Nevertheless, the demand for wastewater treatment services during construction under the proposed project would be temporary and would generate minimal wastewater. The proposed project is consistent with the Land Use PlaceType identified for the project site in the 2019 PEIR; therefore, the proposed project would be included within the estimated wastewater flow under the LUE/UDE, which was estimated to be approximately 4 percent of the remaining capacity of existing LACSD facilities. However, as discussed previously, new units and non-residential developments are likely to use significantly less water and thereby generate less wastewater due to building codes requiring reduced water consumption and reduced landscaping associated with proposed development. Therefore, projected future increase in wastewater flows associated with development that may occur with implementation of the proposed project would not exceed the treatment requirements of the RWQCB for the JWPCP and the Long Beach WRP of the LACSD. The proposed project would be required to comply with any requirements, including sewer capacity considerations, as part of the City development review and approval process. The proposed project is consistent with the location, intensity and type of future development contemplated under the 2019 PEIR analysis for the LUE/UDE. Therefore, the proposed project would

not substantially increase the severity of previously identified wastewater impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Stormwater Drainage

As described in the 2019 PEIR, future development facilitated by the LUE/UDE is required to comply with the provisions of the National Pollution Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), or any other subsequent applicable permits. The Construction General Permit requires preparation of a Storm Water Pollution Prevention Plan (SWPPP) to identify Construction BMPs in order to reduce impacts to water quality, including those impacts associated with soil erosion, siltation, spills, and increased runoff. Furthermore, as individual projects facilitated by the LUE/UDE are proposed, the City would review grading plans and construction documents to identify project features aimed at reducing construction impacts to storm drain facilities. Where necessary, the City would identify project conditions to ensure the adequate capacity and operation of the storm drain system during construction activities. Therefore, the 2019 PEIR determined that construction activities associated with implementation of the LUE/UDE would not require or result in the relocation or construction of new stormwater drainage systems, the construction of which would cause significant environmental impacts. As described in the 2019 PEIR, development of projects facilitated by the LUE/UDE could increase impervious surface area, which could reduce infiltration and increase runoff. Future projects would be reviewed on a project-by-project basis and would need to comply with any requirements in effect when the review is conducted, including payment of Development Fees to fund future improvements to the City's stormwater infrastructure. Such improvements were outlined in the City's 2019 Capital Improvement Program and included upgrades related to storm drain pipelines, pump stations, and stormwater monitoring equipment. Depending on the size and nature of the future projects, a Water Quality Management Plan (WQMP) would be developed to address post-construction urban runoff and stormwater pollution from new development and significant redevelopment projects. Future projects are also required to comply with goals and policies outlined in the adopted LUE that were aimed at reducing stormwater runoff and mitigating off-site impacts related to pollutants entering natural water bodies. Therefore, the 2019 PEIR determined that the LUE/UDE would result in less than significant impacts related to the construction or expansion of stormwater drainage facilities, and no mitigation was required.

Refer to Section 5.9, Hydrology and Water Quality, of this Environmental Compliance Checklist. The proposed project would comply with current NPDES and Los Angeles County MS4 permit regulations pertaining to the retention of stormwater and detention of site runoff into storm drains. Additionally, the Chapter 18.74 of the LBMC regulates the implementation of the LIDs and BMPs for projects in the City. Compliance with these requirements would reduce potential impacts to local stormwater drainage facilities to a less than significant level.

The proposed project is located on a site over one acre in size and therefore would be required to obtain coverage under and comply with the requirements of the Construction General Permit. In addition, the proposed project would disturb soil and would be required to submit an Erosion and Sediment Control Plan to the City for review and approval (required by LU Policy 20-12), which would identify BMPs to reduce construction-related pollutants discharged to the stormdrain system.

Additionally, because the proposed project would be developed on an existing outdoor pipe storage yard, the proposed project would result in a net increase in impervious surface area. As specified by the City's MS4 Permit, because the proposed project would be classified as a significant redevelopment project, the preparation and implementation of a WQMP would be required. The WQMP would specify post-construction BMPs to reduce stormwater pollution from the project site. Further, the proposed project would comply with goals and policies outlined in the proposed LUE that were aimed at reducing stormwater runoff and mitigating off-site impacts related to pollutants entering natural water bodies. For the reasons outlined above, the proposed project would not substantially increase the severity of previously identified stormwater drainage impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Telecommunications facilities

As described in the 2019 PEIR, construction activities associated with future projects facilitated by the LUE/UDE would not increase the demand for telecommunications facilities, and thus would not require or result in the construction of new or the relocation of existing telecommunication facilities. However, development facilitated by the LUE/UDE could result in the need for new or relocated telecommunications facilities. Similar to the existing market conditions, Spectrum Communications, Frontier Communications, and AT&T U-Verse would extend existing services to meet the increased demand for telephone, internet, and cable services as future developments are proposed. Where necessary, infrastructure improvements would be made to existing telecommunications facilities in order to meet customer demands. Environmental impacts associated with future improvements to telecommunications facilities were anticipated to be minimal, as these facility areas would have previously been disturbed through association with past infrastructure improvements. In addition, any major improvements to telecommunications facilities would be reviewed on a project-by-project basis, and would comply with any applicable regulations in place at the time such development is proposed. Therefore, the 2019 PEIR determined that the implementation of the LUE/UDE would result in less than significant impacts related to the construction or relocation of existing telecommunications facilities, and no mitigation was required.

Similar to the existing market conditions, the telecommunications business offering service to the project site (Spectrum Communications, Frontier Communications, or AT&T U-Verse) would extend existing services to meet the increased demand for telephone, internet, and cable services under the proposed project. Environmental impacts associated with the proposed project related to telecommunications facilities are anticipated to be minimal, as these facility areas have previously been disturbed through association with past infrastructure improvements. Further, the project site is located in a built-out urban area where such telecommunications services currently are provided. Therefore, because the proposed project is consistent with the NI PlaceType, and is within the range of what was contemplated in the 2019 PEIR, the project would not substantially increase the severity of previously identified telecommunications impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

4.9.2 Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Refer to the discussion under, Threshold 4.9.1. The proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

4.9.3 Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Refer to the discussion under, Threshold 4.9.1. The proposed project would not substantially increase the severity of previously identified impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

4.9.4 Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

As described in the 2019 PEIR, construction of future projects facilitated by the LUE/UDE would generate demolition waste. Construction waste would be recycled pursuant to Chapter 18.67, Construction and Demolition Recycling Program, of the City's Municipal Code. Under the Municipal Code, projects requiring demolition or building permits are required to divert at least 60 percent of all construction and demolition material from landfills. As described in the 2019 PEIR, solid waste generated by operations associated with future development under the LUE/UDE would be collected by the City's Environmental Services Bureau and hauled to the Southeast Resource Recovery Facility (SERRF). Under the LUE/UDE, the City was forecast to generate approximately 1.62 million pounds of solid waste in 2040, or an increase of approximately 193,744 lbs/day. The 2019 PEIR determined that sufficient landfill capacity exists in the region to serve solid waste generated by the LUE/UDE. In addition, all future projects facilitated by the LUE/UDE would be required to comply with federal, State, and local statutes and regulations related to solid waste. Therefore, the 2019 PEIR determined that impacts related to solid waste generation would be less than significant, and no mitigation was required.

Construction waste generated under the proposed project would be recycled pursuant to Chapter 18.67, Construction and Demolition Recycling Program, of the City's Municipal Code. Under the Municipal Code, projects requiring demolition or building permits are required to divert at least 60 percent of all construction and demolition material from landfills. Solid waste generated by operations activities associated with the proposed project would be collected by the City's Environmental Services Bureau and hauled to the SERRF. The 2019 PEIR forecast that the City would generate approximately 1.62 million pounds of solid waste in 2040, or an increase of approximately 193,744 lbs/day. The proposed project is within the range of what was contemplated in the 2019 PEIR analysis for the LUE buildout in the year 2040. As sufficient landfill capacity exists in the region to serve solid waste generated by the proposed project, and because the proposed project would be

required to comply with federal, State, and local statutes and regulations related to solid waste, no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

This project has been developed in adherence with the LUE and UDE Goals, Strategies, and Policies intended to reduce the impacts of future development envisioned under the 2019 PEIR. There are no applicable compliance measures or project design features related to utilities and service systems from the 2019 PEIR to which this project must adhere. No mitigation for subsequent projects was identified in the 2019 PEIR.

5.18 ENERGY

		2019 PEIR Determination	New Potentially Significant Impact Not Identified in 2019 PEIR	No Impact/ No Change to 2019 PEIR
Would the project:				
4.10.1	Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?	Less than Significant Impact	☐	☒
4.10.2	Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	Less than Significant Impact	☐	☒

Impact Analysis

4.10.1 *Would the project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?*

Electricity. As described in the 2019 PEIR, energy would be consumed throughout construction and operation of future projects facilitated by implementation of the LUE/UDE. As such, the LUE/UDE would facilitate energy consumption during construction for the transportation of building materials, manufacturing of building materials, and the actual construction of buildings and infrastructure improvements. The LUE/UDE would also facilitate energy consumption during operation associated with building heating and cooling, use of consumer products, lighting, and vehicular traffic. The projected electricity demand in the City in 2040 is expected to be approximately 117.18 percent greater than the existing electricity demand. However, many of the land uses under the approved LUE/UDE would replace existing uses that already utilize electricity resources. Furthermore, energy efficiency technologies would continue to improve through horizon year 2040. New facilities required to support the project-related demand for electricity would be constructed in accordance with the demand for the new service. Potential environmental impacts would be evaluated on a project-by project basis. However, because the City is largely built out, it is not anticipated that major new facilities are necessary to serve new development facilitated by implementation of the LUE/UDE for the horizon year of the General Plan build out (2040). Therefore, the 2019 PEIR determined that impacts were less than significant, and no mitigation was required.

The proposed project includes the construction of two industrial buildings and the reuse of an existing 5,827 square foot industrial building that would consume electricity during construction and throughout operation of the project. During construction of the proposed project, energy consumption would occur during the transportation of building materials, manufacturing of building materials, and the actual construction of buildings and infrastructure improvements. Energy consumption during operation would be associated with building heating and cooling, use of consumer products, lighting, and vehicular traffic.

An Energy Analysis (Appendix K) was prepared to analyze the anticipated energy demands for the proposed project. As shown on Table 4-3 (Appendix K), the total electricity usage from on-site project construction related activities is estimated to be approximately 99,696 kWh. As shown in Table 4-18 (Appendix K), the proposed Project is anticipated to require less electricity when compared to facility energy demands of the currently adopted General Plan land use. Project facility operational energy demands are estimated at 848,589 kWh/year of electricity. The project proposes conventional industrial uses reflecting contemporary energy efficient/energy conserving designs and operational programs. The project does not propose uses that are inherently energy intensive and the energy demands in total would be comparable to other industrial uses of similar scale and configuration.

The proposed project is consistent with the Land Use PlaceType identified for the project site in the 2019 PEIR; therefore, the proposed project's electricity demand is included within the 2019 PEIR analysis of the LUE/UDE. Furthermore, it is anticipated that the City has existing infrastructure to support the electricity demands of the proposed project, and the construction of new facilities would not be required. Therefore, the proposed project would not substantially increase the severity of previously identified electricity impacts in the 2019 PEIR, and no new impacts beyond those identified in the 2019 PEIR would occur. No further study of this issue is warranted.

Natural Gas. The 2019 PEIR found that future development that would occur under the LUE/UDE would generate an approximately 16.34 percent increase in natural gas demand. The 2019 PEIR assumed the anticipated General Plan build out, which is a worst-case analysis, since it is unknown how much of the proposed residential and non-residential uses would actually be constructed. In addition, many of the land uses as proposed under the LUE/UDE would replace existing uses that already utilize natural gas resources. Under the LUE/UDE, gas service would be added to the existing system operated and maintained by the Long Beach Energy Resources (ER) Department, as necessary, to meet the requirements of individual projects within the City. Because future developments considered under the LUE/UDE had not yet been designed or proposed, the specific improvements to existing natural gas facilities needed to serve future developments were unknown at the time of the preparation of the 2019 PEIR. Potential environmental impacts would be evaluated on a project-by project basis. However, because the City is largely built out, it is not anticipated that major improvements would be necessary to serve the City and new development facilitated by the LUE/UDE. Therefore, the 2019 PEIR determined that impacts were less than significant, and no mitigation was required.

The Energy Analysis (Appendix K) was prepared for the proposed project. As shown in Table 4-18 (Appendix K), the proposed Project is anticipated to require less natural gas demand when compared to facility energy demands of the currently adopted General Plan land use. Project facility operational energy demands are estimated at 919,553 kBtu/year of natural gas. The project proposes conventional industrial uses reflecting contemporary energy efficient/energy conserving designs and operational programs. The project does not propose uses that are inherently energy intensive and the energy demands in total would be comparable to other industrial uses of similar scale and configuration.

Gas service for the proposed project would be added to the existing system operated and maintained by the Long Beach ER Department. The proposed project is consistent with the Land Use

PlaceType identified for the project site in the 2019 PEIR; therefore, the proposed project's natural gas demand is included within the approximate 16.34 percent increase in natural gas demand as analyzed in the 2019 PEIR. Therefore, the proposed project would not substantially increase the severity of previously identified natural gas impacts in the 2019 PEIR. No new impacts beyond those identified in the 2019 PEIR would occur, and no further study of this issue is warranted.

Gasoline. From 2018 to 2040, the 2019 PEIR determined that VMT per capita is projected to decrease by approximately 9 percent, and VMT per household is projected to decrease by approximately 19 percent. The decrease in VMT per capita and per household would likely result in an associated decrease in the demand for gasoline. Moreover, the fuel efficiency of vehicles is expected to continue to increase and improve throughout the life of the LUE/UDE as new fuel economy standards are established. Therefore, the 2019 PEIR determined that the implementation of the LUE/UDE would not result in a substantial increase in transportation-related energy uses, such that it would result in a wasteful, inefficient, or unnecessary consumption of energy resources. Impacts were considered less than significant, and no mitigation was required.

The Energy Analysis (Appendix K) considered gasoline consumption for both construction and operation of the proposed project. Construction equipment used by the Project would result in single event consumption of approximately 61,967 gallons of diesel fuel. Construction equipment use of fuel would not be atypical for the type of construction proposed because there are no aspects of the project's proposed construction process that are unusual or energy-intensive, and project construction equipment would conform to the applicable CARB emissions standards, acting to promote equipment fuel efficiencies. Construction worker trips for full construction of the project would result in the estimated fuel consumption of 37,463 gallons of fuel. Additionally, fuel consumption from construction vendor and hauling trips (MHDTs and HHDTs) will total approximately 22,011 gallons. Diesel fuel would be supplied by City and regional commercial vendors. Indirectly, construction energy efficiencies and energy conservation would be achieved using bulk purchases, transport and use of construction materials. The studies have shown that fuel efficiencies are getting better within on and off-road vehicle engines due to more stringent government requirements. As supported by the preceding discussions, Project construction energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary.

Fuel would be provided by current and future commercial vendors. Trip generation and VMT generated by the Project are consistent with other industrial uses of similar scale and configuration, as reflected respectively in the Institute of Transportation Engineers (ITE) Trip Generation Manual (10th Ed., 2017); and CalEEMod. As such, Project operations would not result in excessive and wasteful vehicle trips and VMT, nor excess and wasteful vehicle energy consumption compared to other industrial uses.

The proposed Project would implement project design features that would facilitate the accessibility, parking, and loading of trucks on site. Enhanced fuel economies realized pursuant to federal and state regulatory actions, and related transition of vehicles to alternative energy sources (e.g., electricity, natural gas, biofuels, hydrogen cells) would likely decrease future gasoline fuel demands per VMT. Location of the Project proximate to regional and local roadway systems tends to reduce VMT within the region, acting to reduce regional vehicle energy demands. The Project would implement sidewalks, facilitating and encouraging pedestrian access. Facilitating pedestrian and

bicycle access would reduce VMT and associated energy consumption. In compliance with the California Green Building Standards Code and City requirements, the Project would promote the use of bicycles as an alternative mean of transportation by providing short-term and/or long-term bicycle parking accommodations. As supported by the preceding discussions, Project transportation energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary.

As described in the 2019 PEIR, the anticipated decrease in VMT per capita and per household, including the proposed project, would likely result in an associated decrease in the demand for gasoline. Moreover, the fuel efficiency of vehicles is expected to continue to increase and improve throughout the life of the proposed project as new fuel economy standards are established. The proposed project is consistent with the LUE/UDE. Transportation-related energy uses facilitated by implementation of the proposed project would be consistent with the LUE/UDE. Therefore, no new impacts beyond those identified in the 2019 PEIR would occur, and no further study of this issue is warranted.

4.10.2 Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

The 2019 PEIR found that future projects facilitated by the LUE/UDE would be required to comply with the CALGreen Code building efficiency standards (Title 24, Part 11) and the California Energy Code Building Energy Efficiency Standards (Title 24, Part 6), which includes provisions related to insulation and design aimed at minimizing energy consumption. Future projects facilitated by implementation of the LUE/UDE would be required to comply with goals, policies, and strategies outlined in the LUE and UDE that are aimed at reducing energy consumption in the planning area. These goals, policies, and strategies were developed in accordance with federal and State energy regulations, such as CALGreen Code building efficiency standards (Title 24, Part 11), the California Energy Code Building Energy Efficiency Standards (Title 24, Part 6), and SB 743, which are also aimed at reducing energy consumption. Therefore, the 2019 PEIR determined that the LUE/UDE was consistent with applicable plans related to renewable energy and energy efficiency, and no mitigation was required.

The proposed project is consistent with the Land Use PlaceType identified in the 2019 PEIR and would be required to comply with the CALGreen Code building efficiency standards (Title 24, Part 11) and the California Energy Code Building Energy Efficiency Standards (Title 24, Part 6), which includes provisions related to insulation and design aimed at minimizing energy consumption. Section 5.2 of the Energy Analysis (Appendix K) analyzes project's consistency with the applicable state and local plans. Additionally, the proposed project would be required to comply with goals, policies, and strategies outlined in the LUE and UDE that are aimed at reducing energy consumption in the City. Energy uses facilitated by implementation of the proposed project would be consistent with the LUE/UDE. Therefore, no new impacts beyond those identified in the 2019 PEIR would occur, and no further study of this issue is warranted.

Applicable Compliance Measures, Mitigation Measures, and Project Design Features

This project has been developed in adherence with the LUE and UDE Goals, Strategies, and Policies intended to reduce the impacts of future development envisioned under the 2019 PEIR. There are

no applicable compliance measures or project design features related to energy to which this project must adhere. No mitigation for subsequent projects was identified in the 2019 PEIR.

5.19 WILDFIRE

Based on the analysis contained in the 2019 General Plan PEIR, impacts associated with wildfires were determined to be less than significant. The California Department of Forestry and Fire Protection (CAL FIRE) publishes maps that predict the threat of fire in individual counties in the State; Local Responsibility Areas and State or Federal Responsibility Areas are classified as either very high fire hazard severity zones (VHFHSZ) or non-VHFHSZ based on factors including fuel availability, topography, fire history, and climate. The project area is not located in or near a State Responsibility Area and does not include land classified as VHFHSZ as defined by CAL FIRE.

The proposed project is an example of an infill site that is already developed and would be redeveloped under the proposed project. The proposed project would be required to comply with policies set forth in the City's General Plan Public Safety Element (1975) related to emergency preparedness and evacuation procedures. In addition, the proposed project would not result in the installation or maintenance of associated infrastructure that could exacerbate fire risk or that may result in temporary or ongoing impacts to the environment. Furthermore, since the surrounding area is generally built out, there are no properties adjacent to wildlands and there are no properties designated as being at risk for wildfires by CAL FIRE. Therefore, implementation of the proposed project would not result in impacts related to emergency response activities or wildfire risks. For these reasons, impacts with respect to wildfires are not evaluated further for the proposed project.

6.0 CONCLUSION

Based on the analysis contained in this Environmental Compliance Checklist, the proposed project will not result in any new environmental impacts not identified in the General Plan LUE/UDE Recirculated PEIR (2019 PEIR). Consistent with *State CEQA Guidelines* Section 15183,³ there are no effects peculiar to the project or project site or substantial new information that would result in new or more severe adverse impacts than discussed in the 2019 PEIR. Therefore, no further analysis or additional CEQA documentation is required for the project.

³ *State CEQA Guidelines* Section 15183 allows streamlining for projects that are consistent with the development density established by existing zoning, community plan, or general plan policies for which an EIR was certified.

EXECUTIVE SUMMARY

Pursuant to California Environmental Quality Act (CEQA) § 15164 (a) the lead agency shall prepare an addendum to a previously certified Environmental Impact Report (EIR) if some changes or additions are necessary but none of the conditions described in §15162 calling for preparation of a subsequent EIR have occurred. More specifically, §15162 (a)(3)(A) states that no subsequent EIR shall be prepared for the project unless the project will have one or more significant effects not discussed in the previous EIR. Section 15162(a)(3)(B) states that no subsequent EIR shall be prepared for the project unless significant effects previously examined will be substantially more severe than shown in the previous EIR. Significant and unavoidable construction and operational impacts were previously identified and disclosed in the previously analyzed *Final Recirculated Environmental Impact Report General Plan Land Use and Urban Design Elements SCH No. 2015051054* (referred to herein as *LUE EIR*), which determined that construction and operational-related emissions of volatile organic compounds (VOCs), nitrogen oxides (NO_x), carbon monoxide (CO), particulate matter 10 microns in diameter or less (PM₁₀), and particulate matter 2.5 microns in diameter or less (PM_{2.5}) would exceed the South Coast Air Quality Management District's (SCAQMD) thresholds of significance (1).

Based on the project-specific analysis, the Project's air quality emissions would be the same as or less than what was disclosed in the *LUE EIR*; thus, the Project would not result in any new or more severe impacts to air quality beyond what was disclosed by the *LUE EIR*.

ES.1 SUMMARY OF FINDINGS

The results of this *San Francisco Avenue Air Quality Impact Analysis* (AQIA) are summarized below based on the significance criteria in Section 3 of this report consistent with Appendix G of the *CEQA Guidelines* (2). Table ES-1 shows the findings of less than significant for each potential air quality impact under CEQA. The Project is required to comply with the applicable *LUE EIR* Project Design Features and Mitigation Measures (MM). As shown, no MMs beyond those already identified in the *LUE EIR* are required.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Section	Significance Findings			New Significant Impact?
		LUE EIR	Proposed Project		
			Unmitigated	Mitigated	
Regional Construction Emissions	3.4	Significant and Unavoidable	Less Than Significant	n/a	NO
Localized Construction Emissions	3.8	Significant and Unavoidable	Less Than Significant	n/a	NO
Regional Operational Emissions	3.5	Significant and Unavoidable	Less Than Significant	n/a	NO
Localized Operational Emissions	3.9	Significant and Unavoidable	Less Than Significant	n/a	NO
CO “Hot Spot” Analysis	3.10	Less Than Significant	Less Than Significant	n/a	NO
Air Quality Management Plan	3.11	Significant and Unavoidable	Less Than Significant	n/a	NO
Sensitive Receptors	3.12	Less Than Significant	Less Than Significant	n/a	NO
Odors	3.13	Less Than Significant	Less Than Significant	n/a	NO
Cumulative Impacts	3.14	Significant and Unavoidable	Less Than Significant	n/a	NO

ES.2 REGULATORY REQUIREMENTS

There are numerous requirements that development projects must comply with by law, and that were put in place by federal, State, and local regulatory agencies for the improvement of air quality.

Any operation or activity that might cause the emission of any smoke, fly ash, dust, fumes, vapors, gases, or other forms of air pollution, which can cause damage to human health, vegetation, or other forms of property, or can cause excessive soiling on any other parcel shall conform to the requirements of the SCAQMD.

SCAQMD RULES

SCAQMD Rules that are currently applicable during construction activity for this Project are described below.

SCAQMD RULE 403

This rule is intended to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (human-made) fugitive dust sources by requiring actions to prevent and reduce fugitive dust emissions. Rule 403 applies to any activity or human-made condition capable of generating fugitive dust and requires best available control measures to be applied to earth moving and grading activities.

Dust Control, Operations. Any operation or activity that might cause the emission of any smoke, fly ash, dust, fumes, vapors, gases, or other forms of air pollution, which can cause damage to human health, vegetation, or other forms of property, or can cause excessive soiling on any other parcel, shall conform to the requirements of the SCAQMD.

SCAQMD RULE 1113

This rule serves to limit the VOC content of architectural coatings used on projects in the SCAQMD. Any person who supplies, sells, offers for sale, or manufactures any architectural coating for use on projects.

TITLE 24

The proposed project is required to comply with Title 24 of the California Code of Regulations (CCR) established by the California Energy Commission (CEC) regarding energy conservation standards.

ES.3 PROJECT MITIGATION MEASURES

The Project would not result in an exceedance of any regional or localized construction or operational-source emissions thresholds. As such, the Project would not result in any significant impacts and no MMs are required.

This page intentionally left blank

1 INTRODUCTION

This report presents the results of the AQIA prepared by Urban Crossroads, Inc., for the proposed San Francisco Avenue (Project). The purpose of this AQIA is to evaluate the potential impacts to air quality associated with construction and operation of the Project and recommend measures to mitigate impacts considered potentially significant in comparison to thresholds established by the SCAQMD.

1.1 SITE LOCATION

The proposed Project is located on the southwest corner of San Francisco Avenue and Anaheim Street in the City of Long Beach, as shown on Exhibit 1-A. Existing land uses near the site include nearby residences located east and southeast of the Project site. The Los Angeles River is located to the west of the Project site.

1.2 PROJECT DESCRIPTION

The proposed Project is to consist of two warehouse buildings totaling 123,595 square feet (sf) with Building 1 at 62,042 square feet, Building 2 at 61,553 square feet, and an existing 5,827 square foot building (to remain) as shown on Exhibit 1-B. For the purposes of this assessment, the mix of uses for the Project is assumed to consist of 61,797 square feet of warehousing use (no less than 50% warehousing use anticipated) and 61,798 square feet of general light industrial use (remaining 50% of the total square footage). The Project is anticipated to be open by the year 2022.

This analysis includes a conservative assumption of on-site Project-related emission sources for potential future tenants, including architectural coatings, consumer products, landscape maintenance equipment, emissions associated with natural gas and electricity, and mobile source emissions. This analysis is intended to describe air impacts associated with the expected operational activities at the Project site. This report assumes the Project will operate 24-hours daily for seven days per week.

EXHIBIT 1-A: LOCATION MAP

EXHIBIT 1-B: SITE PLAN

This page intentionally left blank

2 AIR QUALITY SETTING

This section provides an overview of the existing air quality conditions in the Project area and region.

2.1 SOUTH COAST AIR BASIN (SCAB)

The Project site is located in the SCAB within the jurisdiction of SCAQMD (3). The SCAQMD was created by the 1977 Lewis-Presley Air Quality Management Act, which merged four county air pollution control bodies into one regional district. Under the Act, the SCAQMD is responsible for bringing air quality in areas under its jurisdiction into conformity with federal and state air quality standards. As previously stated, the Project site is located within the SCAB, a 6,745-square mile subregion of the SCAQMD, which includes portions of Los Angeles, Riverside, and San Bernardino Counties, and all of Orange County.

The SCAB is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Los Angeles County portion of the Mojave Desert Air Basin is bounded by the San Gabriel Mountains to the south and west, the Los Angeles / Kern County border to the north, and the Los Angeles / San Bernardino County border to the east. The Riverside County portion of the Salton Sea Air Basin is bounded by the San Jacinto Mountains in the west and spans eastward up to the Palo Verde Valley.

2.2 REGIONAL CLIMATE

The regional climate has a substantial influence on air quality in the SCAB. In addition, the temperature, wind, humidity, precipitation, and amount of sunshine influence the air quality.

The annual average temperatures throughout the SCAB vary from the low to middle 60 degrees Fahrenheit (°F). Due to a decreased marine influence, the eastern portion of the SCAB shows greater variability in average annual minimum and maximum temperatures. January is the coldest month throughout the SCAB, with average minimum temperatures of 47°F in downtown Los Angeles and 36°F in San Bernardino. All portions of the SCAB have recorded maximum temperatures above 100°F.

Although the climate of the SCAB can be characterized as semi-arid, the air near the land surface is quite moist on most days because of the presence of a marine layer. This shallow layer of sea air is an important modifier of SCAB climate. Humidity restricts visibility in the SCAB, and the conversion of sulfur dioxide (SO₂) to sulfates (SO₄) is heightened in air with high relative humidity. The marine layer provides an environment for that conversion process, especially during the spring and summer months. The annual average relative humidity within the SCAB is 71 percent (%) along the coast and 59% inland. Since the ocean effect is dominant, periods of heavy early morning fog are frequent and low stratus clouds are a characteristic feature. These effects decrease with distance from the coast.

More than 90% of the SCAB's rainfall occurs from November through April. The annual average rainfall varies from approximately nine inches in Riverside to fourteen inches in downtown Los

Angeles. Monthly and yearly rainfall totals are extremely variable. Summer rainfall usually consists of widely scattered thunderstorms near the coast and slightly heavier shower activity in the eastern portion of the SCAB with frequency being higher near the coast.

Due to its generally clear weather, about three-quarters of available sunshine is received in the SCAB. The remaining one-quarter is absorbed by clouds. The ultraviolet portion of this abundant radiation is a key factor in photochemical reactions. On the shortest day of the year there are approximately 10 hours of possible sunshine, and on the longest day of the year there are approximately 14½ hours of possible sunshine.

The importance of wind to air pollution is considerable. The direction and speed of the wind determines the horizontal dispersion and transport of the air pollutants. During the late autumn to early spring rainy season, the SCAB is subjected to wind flows associated with the traveling storms moving through the region from the northwest. This period also brings five to ten periods of strong, dry offshore winds, locally termed “Santa Anas” each year. During the dry season, which coincides with the months of maximum photochemical smog concentrations, the wind flow is bimodal, typified by a daytime onshore sea breeze and a nighttime offshore drainage wind. Summer wind flows are created by the pressure differences between the relatively cold ocean and the unevenly heated and cooled land surfaces that modify the general northwesterly wind circulation over southern California. Nighttime drainage begins with the radiational cooling of the mountain slopes. Heavy, cool air descends the slopes and flows through the mountain passes and canyons as it follows the lowering terrain toward the ocean. Another characteristic wind regime in the SCAB is the “Catalina Eddy,” a low level cyclonic (counterclockwise) flow centered over Santa Catalina Island which results in an offshore flow to the southwest. On most spring and summer days, some indication of an eddy is apparent in coastal sections.

In the SCAB, there are two distinct temperature inversion structures that control vertical mixing of air pollution. During the summer, warm high-pressure descending (subsiding) air is undercut by a shallow layer of cool marine air. The boundary between these two layers of air is a persistent marine subsidence/inversion. This boundary prevents vertical mixing which effectively acts as an impervious lid to pollutants over the entire SCAB. The mixing height for the inversion structure is normally situated 1,000 to 1,500 feet above mean sea level.

A second inversion-type forms in conjunction with the drainage of cool air off the surrounding mountains at night followed by the seaward drift of this pool of cool air. The top of this layer forms a sharp boundary with the warmer air aloft and creates nocturnal radiation inversions. These inversions occur primarily in the winter when nights are longer and onshore flow is weakest. They are typically only a few hundred feet above mean sea level. These inversions effectively trap pollutants, such as NO_x and CO from vehicles, as the pool of cool air drifts seaward. Winter is therefore a period of high levels of primary pollutants along the coastline.

2.3 WIND PATTERNS AND PROJECT LOCATION

The distinctive climate of the Project area and the SCAB is determined by its terrain and geographical location. The SCAB is located in a coastal plain with connecting broad valleys and

low hills, bounded by the Pacific Ocean in the southwest quadrant with high mountains forming the remainder of the perimeter.

Wind patterns across the south coastal region are characterized by westerly and southwesterly onshore winds during the day and easterly or northeasterly breezes at night. Winds are characteristically light although the speed is somewhat greater during the dry summer months than during the rainy winter season.

2.4 CRITERIA POLLUTANTS

Criteria pollutants are pollutants that are regulated through the development of human health based and/or environmentally based criteria for setting permissible levels. Criteria pollutants, their typical sources, and health effects are identified below (4):

TABLE 2-1: CRITERIA POLLUTANTS

Criteria Pollutant	Description	Sources	Health Effects
CO	CO is a colorless, odorless gas produced by the incomplete combustion of carbon-containing fuels, such as gasoline or wood. CO concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike ozone (O ₃), motor vehicles operating at slow speeds are the primary source of CO in the SCAB. The highest ambient CO concentrations are generally found near congested transportation corridors and intersections.	Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.	Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of decreased oxygen (O ₂) supply to the heart. Inhaled CO has no direct toxic effect on the lungs but exerts its effect on tissues by interfering with O ₂ transport and competing with O ₂ to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for O ₂ supply can be adversely affected by exposure to CO. Individuals most at risk include fetuses, patients with diseases involving heart and blood vessels, and patients with chronic hypoxemia (O ₂ deficiency) as seen at high altitudes.

Criteria Pollutant	Description	Sources	Health Effects
SO ₂	SO ₂ is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. When SO ₂ oxidizes in the atmosphere, it forms SO ₄ . Collectively, these pollutants are referred to as sulfur oxides (SO _x).	Coal or oil burning power plants and industries, refineries, diesel engines	A few minutes of exposure to low levels of SO₂ can result in airway constriction in some asthmatics, all of whom are sensitive to its effects. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, are observed after acute exposure to SO₂. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO₂. Animal studies suggest that despite SO₂ being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO₂ levels. In these studies, efforts to separate the effects of SO₂ from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically, or one pollutant alone is the predominant factor.

Criteria Pollutant	Description	Sources	Health Effects
NO _x	NO_x consist of nitric oxide (NO), nitrogen dioxide (NO₂) and nitrous oxide (N₂O) and are formed when nitrogen (N₂) combines with O₂. Their lifespan in the atmosphere ranges from one to seven days for nitric oxide and nitrogen dioxide, to 170 years for nitrous oxide. NO_x is typically created during combustion processes and are major contributors to smog formation and acid deposition. NO₂ is a criteria air pollutant and may result in numerous adverse health effects; it absorbs blue light, resulting in a brownish-red cast to the atmosphere and reduced visibility. Of the seven types of NO_x compounds, NO₂ is the most abundant in the atmosphere. As ambient concentrations of NO₂ are related to traffic density, commuters in heavy traffic may be exposed to higher concentrations of NO₂ than those indicated by regional monitoring station.	Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.	Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposure to NO₂ at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO₂ in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups. In animals, exposure to levels of NO₂ considerably higher than ambient concentrations result in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of O₃ exposure increases when animals are exposed to a combination of O₃ and NO₂.
O ₃	O ₃ is a highly reactive and unstable gas that is formed when VOCs and NO _x , both byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. O ₃ concentrations are generally	Formed when reactive organic gases (ROG) and NO _x react in the presence of sunlight. ROG sources	Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible sub-groups for O ₃ effects. Short-

Criteria Pollutant	Description	Sources	Health Effects
	highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant.	include any source that burns fuels, (e.g., gasoline, natural gas, wood, oil) solvents, petroleum processing and storage and pesticides.	term exposure (lasting for a few hours) to O₃ at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. Elevated O₃ levels are associated with increased school absences. In recent years, a correlation between elevated ambient O₃ levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple outdoor sports and reside in communities with high O₃ levels. O₃ exposure under exercising conditions is known to increase the severity of the responses described above. Animal studies suggest that exposure to a combination of pollutants that includes O₃ may be more toxic than exposure to O₃ alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.
Particulate Matter	PM ₁₀ : A major air pollutant consisting of tiny solid or liquid particles of soot, dust, smoke, fumes, and aerosols. Particulate matter pollution is a major cause of reduce visibility (haze) which is	Sources of PM ₁₀ include road dust, windblown dust and construction. Also formed from other pollutants (acid	A consistent correlation between elevated ambient fine particulate matter (PM ₁₀ and PM _{2.5}) levels and an increase in mortality rates, respiratory infections,

Criteria Pollutant	Description	Sources	Health Effects
	caused by the scattering of light and consequently the significant reduction air clarity. The size of the particles (10 microns or smaller, about 0.0004 inches or less) allows them to easily enter the lungs where they may be deposited, resulting in adverse health effects. Additionally, it should be noted that PM₁₀ is considered a criteria air pollutant. PM_{2.5}: A similar air pollutant to PM₁₀ consisting of tiny solid or liquid particles which are 2.5 microns or smaller (which is often referred to as fine particles). These particles are formed in the atmosphere from primary gaseous emissions that include SO₄ formed from SO₂ release from power plants and industrial facilities and nitrates that are formed from NO_x release from power plants, automobiles, and other types of combustion sources. The chemical composition of fine particles highly depends on location, time of year, and weather conditions. PM_{2.5} is a criteria air pollutant.	rain, NO_x, SO_x, organics). Incomplete combustion of any fuel. PM_{2.5} comes from fuel combustion in motor vehicles, equipment, and industrial sources, residential and agricultural burning. Also formed from reaction of other pollutants (acid rain, NO_x, SO_x, organics).	number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States (U.S.) and various areas around the world. In recent years, some studies have reported an association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in lifespan, and an increased mortality from lung cancer. Daily fluctuations in PM_{2.5} concentration levels have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children, and to increased medication use in children and adults with asthma. Recent studies show lung function growth in children is reduced with long term exposure to particulate matter. The elderly, people with pre-existing respiratory or cardiovascular disease, and children appear to be more susceptible to the effects of high levels of PM₁₀ and PM_{2.5}.
VOC	VOCs are hydrocarbon compounds (any compound containing various combinations of hydrogen and carbon atoms) that exist in the ambient air. VOCs contribute to the formation of smog through atmospheric photochemical reactions and/or may be toxic. Compounds of carbon (also known as organic	Organic chemicals are widely used as ingredients in household products. Paints, varnishes, and wax all contain organic solvents, as do many cleaning, disinfecting,	Breathing VOCs can irritate the eyes, nose, and throat, can cause difficulty breathing and nausea, and can damage the central nervous system as well as other organs. Some VOCs can cause cancer. Not all VOCs have all these health effects, though many have several.

Criteria Pollutant	Description	Sources	Health Effects
	compounds) have different levels of reactivity; that is, they do not react at the same speed or do not form O ₃ to the same extent when exposed to photochemical processes. VOCs often have an odor, and some examples include gasoline, alcohol, and the solvents used in paints. Exceptions to the VOC designation include CO, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate. VOCs are a criteria pollutant since they are a precursor to O ₃ , which is a criteria pollutant. The terms VOC and ROG (see below) interchangeably.	cosmetic, degreasing and hobby products. Fuels are made up of organic chemicals. All of these products can release organic compounds while you are using them, and, to some degree, when they are stored.	
ROG	Similar to VOC, ROG are also precursors in forming O ₃ and consist of compounds containing methane, ethane, propane, butane, and longer chain hydrocarbons, which are typically the result of some type of combustion/decomposition process. Smog is formed when ROG and NO _x react in the presence of sunlight. ROG are a criteria pollutant since they are a precursor to O ₃ , which is a criteria pollutant. The terms ROG and VOC (see previous) interchangeably.	Sources similar to VOCs.	Health effects similar to VOCs.
Lead (Pb)	Pb is a heavy metal that is highly persistent in the environment and is considered a criteria pollutant. In the past, the primary source of Pb in the air was emissions from vehicles burning leaded gasoline. The major sources of Pb emissions are ore and metals processing, particularly Pb smelters, and piston-engine aircraft operating on leaded aviation gasoline. Other stationary sources include	Metal smelters, resource recovery, leaded gasoline, deterioration of Pb paint.	Fetuses, infants, and children are more sensitive than others to the adverse effects of Pb exposure. Exposure to low levels of Pb can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased Pb levels are

Criteria Pollutant	Description	Sources	Health Effects
	waste incinerators, utilities, and lead-acid battery manufacturers. It should be noted that the Project does not include operational activities such as metal processing or Pb acid battery manufacturing. As such, the Project is not anticipated to generate a quantifiable amount of Pb emissions.		associated with increased blood pressure. Pb poisoning can cause anemia, lethargy, seizures, and death; although it appears that there are no direct effects of Pb on the respiratory system. Pb can be stored in the bone from early age environmental exposure, and elevated blood Pb levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland) and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of Pb because of previous environmental Pb exposure of their mothers.
Odor	Odor means the perception experienced by a person when one or more chemical substances in the air come into contact with the human olfactory nerves (5).	Odors can come from many sources including animals, human activities, industry, natures, and vehicles.	Offensive odors can potentially affect human health in several ways. First, odorant compounds can irritate the eye, nose, and throat, which can reduce respiratory volume. Second, studies have shown that the VOCs that cause odors can stimulate sensory nerves to cause neurochemical changes that might influence health, for instance, by compromising the immune system. Finally, unpleasant odors can trigger memories or attitudes linked to unpleasant odors, causing cognitive and emotional effects such as stress.

2.5 EXISTING AIR QUALITY

Existing air quality is measured at established SCAQMD air quality monitoring stations. Monitored air quality is evaluated in the context of ambient air quality standards. These standards are the levels of air quality that are considered safe, with an adequate margin of safety, to protect the public health and welfare. National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) currently in effect are shown in Table 2-2 (6).

The determination of whether a region's air quality is healthful or unhealthful is determined by comparing contaminant levels in ambient air samples to the state and federal standards. At the time of this AQIA, the most recent state and federal standards were updated by California Air Resources Board (CARB) on May 4, 2016 and are presented in Table 2-2. The air quality in a region is considered to be in attainment by the state if the measured ambient air pollutant levels for O₃, CO (except 8-hour Lake Tahoe), SO₂ (1 and 24 hour), NO₂, PM₁₀, and PM_{2.5} do not exceed standards. All others are not to be equaled or exceeded. It should be noted that the three-year period is presented for informational purposes and is not the basis for how the State assigns attainment status. Attainment status for a pollutant means that the SCAQMD meets the standards set by the Environmental Protection Agency (EPA) or the California EPA (CalEPA). Conversely, nonattainment means that an area has monitored air quality that does not meet the NAAQS or CAAQS standards. In order to improve air quality in nonattainment areas, CARB has implemented a State Implementation Plan (SIP). The SIP outlines the measures that the state will take to improve air quality. Once nonattainment areas meet the standards and additional redesignation requirements, the EPA will designate the area as a maintenance area (7).

TABLE 2-2: AMBIENT AIR QUALITY STANDARDS (1 OF 2)

Ambient Air Quality Standards						
Pollutant	Averaging Time	California Standards ¹		National Standards ²		
		Concentration ³	Method ⁴	Primary ^{3,5}	Secondary ^{3,6}	Method ⁷
Ozone (O ₃) ⁸	1 Hour	0.09 ppm (180 µg/m ³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m ³)		0.070 ppm (137 µg/m ³)

California Air Resources Board (5/4/16)

TABLE 2-2: AMBIENT AIR QUALITY STANDARDS (2 OF 2)

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM₁₀, PM_{2.5}, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM₁₀, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu\text{g}/\text{m}^3$ is equal to or less than one. For PM_{2.5}, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent measurement method which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.
8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
9. On December 14, 2012, the national annual PM_{2.5} primary standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12.0 $\mu\text{g}/\text{m}^3$. The existing national 24-hour PM_{2.5} standards (primary and secondary) were retained at 35 $\mu\text{g}/\text{m}^3$, as was the annual secondary standard of 15 $\mu\text{g}/\text{m}^3$. The existing 24-hour PM₁₀ standards (primary and secondary) of 150 $\mu\text{g}/\text{m}^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
11. On June 2, 2010, a new 1-hour SO₂ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
12. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu\text{g}/\text{m}^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
14. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

California Air Resources Board (5/4/16)

2.6 REGIONAL AIR QUALITY

Air pollution contributes to a wide variety of adverse health effects. The EPA has established NAAQS for six of the most common air pollutants: CO, Pb, O₃, particulate matter (PM₁₀ and PM_{2.5}), NO₂, and SO₂ which are known as criteria pollutants. The SCAQMD monitors levels of various criteria pollutants at 37 permanent monitoring stations and 5 single-pollutant source Pb air monitoring sites throughout the air district (8). On February 21, 2019, CARB posted the 2018 amendments to the state and national area designations. See Table 2-3 for attainment designations for the SCAB (9). Appendix 2.1 provides geographic representation of the state and federal attainment status for applicable criteria pollutants within the SCAB.

TABLE 2-3: ATTAINMENT STATUS OF CRITERIA POLLUTANTS IN THE SCAB

Criteria Pollutant	State Designation	Federal Designation
O ₃ – 1-hour standard	Nonattainment	--
O ₃ – 8-hour standard	Nonattainment	Nonattainment
PM ₁₀	Nonattainment	Attainment
PM _{2.5}	Nonattainment	Nonattainment
CO	Attainment	Unclassifiable/Attainment
NO ₂	Attainment	Unclassifiable/Attainment
SO ₂	Unclassifiable/Attainment	Unclassifiable/Attainment
Pb ¹	Attainment	Unclassifiable/Attainment

Note: See Appendix 2.1 for a detailed map of State/National Area Designations within the SCAB

-- = The national 1-hour O₃ standard was revoked effective June 15, 2005.

2.7 LOCAL AIR QUALITY

The SCAQMD has designated general forecast areas and air monitoring areas (referred to as Source Receptor Areas [SRA]) throughout the district in order to provide Southern California residents about the air quality conditions. The Project site is located within SRA 4. Within SRA 4, the South Coastal Los Angeles County 3 monitoring station, located 1.43 miles northwest, is the nearest station that provides air quality statistics for O₃, CO, NO₂, PM₁₀. As the South Coastal Los Angeles County 3 monitoring station does not provide information for PM_{2.5}, statistics from the South Coastal Los Angeles County 2 monitoring station, 1.62 miles northeast of the Project site, will be reported. It should be noted that the South Coastal Los Angeles County 2 monitoring stations were utilized in lieu of the South Coastal Los Angeles County 3 monitoring station only in instances where data was not available.

The most recent three (3) years of data available is shown on Table 2-4 and identifies the number of days ambient air quality standards were exceeded for the study area, which is considered to be representative of the local air quality at the Development Site. Data for O₃, CO, NO₂, PM₁₀, and PM_{2.5} for 2017 through 2019 was obtained from the SCAQMD Air Quality Data Tables (10).

¹ The Federal nonattainment designation for lead is only applicable towards the Los Angeles County portion of the SCAB.

Additionally, data for SO₂ has been omitted as attainment is regularly met in the SCAB and few monitoring stations measure SO₂ concentrations.

TABLE 2-4: PROJECT AREA AIR QUALITY MONITORING SUMMARY 2017-2019

Pollutant	Standard	Year		
		2017	2018	2019
O ₃				
Maximum Federal 1-Hour Concentration (ppm)		0.082	0.074	0.074
Maximum Federal 8-Hour Concentration (ppm)		0.068	0.063	0.064
Number of Days Exceeding State 1-Hour Standard	> 0.09 ppm	0	0	0
Number of Days Exceeding State/Federal 8-Hour Standard	> 0.070 ppm	0	0	0
CO				
Maximum Federal 1-Hour Concentration	> 35 ppm	3.9	4.7	3.0
Maximum Federal 8-Hour Concentration	> 20 ppm	2.6	2.1	2.1
NO ₂				
Maximum Federal 1-Hour Concentration	> 0.100 ppm	0.090	0.085	0.072
Annual Federal Standard Design Value		0.018	0.017	0.016
PM ₁₀				
Maximum Federal 24-Hour Concentration (µg/m ³)	> 150 µg/m ³	79	84	74
Annual Federal Arithmetic Mean (µg/m ³)		33.3	32.3	26.9
Number of Days Exceeding Federal 24-Hour Standard	> 150 µg/m ³	0	0	0
Number of Days Exceeding State 24-Hour Standard	> 50 µg/m ³	9	4	3
PM _{2.5}				
Maximum Federal 24-Hour Concentration (µg/m ³)	> 35 µg/m ³	56.30	47.10	30.60
Annual Federal Arithmetic Mean (µg/m ³)	> 12 µg/m ³	11.02	11.15	9.22
Number of Days Exceeding Federal 24-Hour Standard	> 35 µg/m ³	5	2	0

ppm = Parts Per Million

µg/m³ = Microgram per Cubic Meter

Source: Data for O₃, CO, NO₂, PM₁₀, and PM_{2.5} was obtained from SCAQMD Air Quality Data Tables.

2.8 REGULATORY BACKGROUND

2.8.1 FEDERAL REGULATIONS

The EPA is responsible for setting and enforcing the NAAQS for O₃, CO, NO_x, SO₂, PM₁₀, and Pb (11). The EPA has jurisdiction over emissions sources that are under the authority of the federal government including aircraft, locomotives, and emissions sources outside state waters (Outer Continental Shelf). The EPA also establishes emission standards for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission requirements of CARB.

The Federal Clean Air Act (CAA) was first enacted in 1955 and has been amended numerous times in subsequent years (1963, 1965, 1967, 1970, 1977, and 1990). The CAA establishes the federal air quality standards, the NAAQS, and specifies future dates for achieving compliance (12). The CAA also mandates that states submit and implement SIPs for local areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met.

The 1990 amendments to the CAA that identify specific emission reduction goals for areas not meeting the NAAQS require a demonstration of reasonable further progress toward attainment and incorporate additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA most directly applicable to the development of the Project site include Title I (Non-Attainment Provisions) and Title II (Mobile Source Provisions) (13) (14). Title I provisions were established with the goal of attaining the NAAQS for the following criteria pollutants O₃, NO₂, SO₂, PM₁₀, CO, PM_{2.5}, and Pb. The NAAQS were amended in July 1997 to include an additional standard for O₃ and to adopt a NAAQS for PM_{2.5}. Table 2-3 (previously presented) provides the NAAQS within the SCAB.

Mobile source emissions are regulated in accordance with Title II provisions. These provisions require the use of cleaner burning gasoline and other cleaner burning fuels such as methanol and natural gas. Automobile manufacturers are also required to reduce tailpipe emissions of hydrocarbons and NO_x. NO_x is a collective term that includes all forms of NO_x which are emitted as byproducts of the combustion process.

2.8.2 CALIFORNIA REGULATIONS

CARB

The CARB, which became part of the CalEPA in 1991, is responsible for ensuring implementation of the California Clean Air Act (AB 2595), responding to the federal CAA, and for regulating emissions from consumer products and motor vehicles. AB 2595 mandates achievement of the maximum degree of emissions reductions possible from vehicular and other mobile sources in order to attain the state ambient air quality standards by the earliest practical date. The CARB established the CAAQS for all pollutants for which the federal government has NAAQS and, in addition, establishes standards for SO₄, visibility, hydrogen sulfide (H₂S), and vinyl chloride (C₂H₃Cl). However, at this time, H₂S and C₂H₃Cl are not measured at any monitoring stations in

the SCAB because they are not considered to be a regional air quality problem. Generally, the CAAQS are more stringent than the NAAQS (15) (11).

Local air quality management districts, such as the SCAQMD, regulate air emissions from stationary sources such as commercial and industrial facilities. All air pollution control districts have been formally designated as attainment or non-attainment for each CAAQS.

Serious non-attainment areas are required to prepare Air Quality Management Plans (AQMP) that include specified emission reduction strategies in an effort to meet clean air goals. These plans are required to include:

- Application of Best Available Retrofit Control Technology to existing sources;
- Developing control programs for area sources (e.g., architectural coatings and solvents) and indirect sources (e.g., motor vehicle use generated by residential and commercial development);
- A District permitting system designed to allow no net increase in emissions from any new or modified permitted sources of emissions;
- Implementing reasonably available transportation control measures and assuring a substantial reduction in growth rate of vehicle trips and miles traveled;
- Significant use of low emissions vehicles by fleet operators;
- Sufficient control strategies to achieve a 5% or more annual reduction in emissions or 15% or more in a period of three years for ROG_s, NO_x, CO and PM₁₀. However, air basins may use alternative emission reduction strategy that achieves a reduction of less than 5% per year under certain circumstances.

TITLE 24 ENERGY EFFICIENCY STANDARDS AND CALIFORNIA GREEN BUILDING STANDARDS

CCR Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. CCR, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on January 1, 2009, and is administered by the California Building Standards Commission.

CALGreen is updated on a regular basis, with the most recent approved update consisting of the 2019 California Green Building Code Standards that became effective January 1, 2020.

Local jurisdictions are permitted to adopt more stringent requirements, as state law provides methods for local enhancements. CALGreen recognizes that many jurisdictions have developed existing construction waste and demolition ordinances and defers to them as the ruling guidance provided, they establish a minimum 65% diversion requirement.

The code also provides exemptions for areas not served by construction waste and demolition recycling infrastructure. The State Building Code provides the minimum standard that buildings must meet in order to be certified for occupancy, which is generally enforced by the local building official.

Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases greenhouse gas (GHG) emissions. The 2019 version of Title 24 was adopted by the CEC and became effective on January 1, 2020.

The 2019 Title 24 standards will result in less energy use, thereby reducing air pollutant emissions associated with energy consumption in the SCAB and across the State of California. For example, the 2019 Title 24 standards will require solar photovoltaic systems for new homes, establish requirements for newly constructed healthcare facilities, encourage demand responsive technologies for residential buildings, and update indoor and outdoor lighting requirements for nonresidential buildings.

The CEC anticipates that single-family homes built with the 2019 standards will use approximately 7% less energy compared to the residential homes built under the 2016 standards. Additionally, after implementation of solar photovoltaic systems, homes built under the 2019 standards will use about 53% less energy than homes built under the 2016 standards. Nonresidential buildings (such as the Project) will use approximately 30% less energy due to lighting upgrade requirements (16).

Because the Project will be constructed after January 1, 2020, the 2019 CALGreen standards are applicable to the Project and require, among other items (17):

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. For new buildings with tenant spaces that have 10 or more tenant-occupants, provide secure bicycle parking for 5% of the tenant-occupant vehicular parking spaces with a minimum of one bicycle parking facility (5.106.4.1.2).
- Designated parking for clean air vehicles. In new projects or additions to alterations that add 10 or more vehicular parking spaces, provide designated parking for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles as shown in Table 5.106.5.2 (5.106.5.2).
- Electric vehicle charging stations. New construction shall facilitate the future installation of electric vehicle supply equipment. The compliance requires empty raceways for future conduit and documentation that the electrical system has adequate capacity for the future load. The number of spaces to be provided for is contained in Table 5.106. 5.3.3 (5.106.5.3).
- Outdoor light pollution reduction. Outdoor lighting systems shall be designed to meet the backlight, upright and glare ratings per Table 5.106.8 (5.106.8)
- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section 5.408.1.1, 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1).
- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).

- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).
- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:
 - Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1)
 - Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor-mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).
 - Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 psi (5.303.3.3.1). When a shower is served by more than one showerhead, the combine flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (5.303.3.3.2).
 - Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).
- Outdoor potable water uses in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (5.304.1).
- Water meters. Separate submeters or metering devices shall be installed for new buildings or additions in excess of 50,000 sf or for excess consumption where any tenant within a new building or within an addition that is project to consume more than 1,000 gallons per day (5.303.1.1 and 5.303.1.2).
- Outdoor water uses in rehabilitated landscape projects equal or greater than 2,500 sf. Rehabilitated landscape projects with an aggregate landscape area equal to or greater than 2,500 sf requiring a building or landscape permit (5.304.3).
- Commissioning. For new buildings 10,000 sf and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

2.8.3 AQMP

Currently, the NAAQS and CAAQS are exceeded in most parts of the SCAB. In response, the SCAQMD has adopted a series of AQMP to meet the state and federal ambient air quality standards (18). AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy. A detailed discussion on the AQMP and Project consistency with the AQMP is provided in Section 3.11.

2.9 REGIONAL AIR QUALITY IMPROVEMENT

The Project is within the jurisdiction of the SCAQMD. In 1976, California adopted the Lewis Air Quality Management Act which created SCAQMD from a voluntary association of air pollution control districts in Los Angeles, Orange, Riverside, and San Bernardino counties. The geographic area of which SCAQMD consists is known as the SCAB. SCAQMD develops comprehensive plans and regulatory programs for the region to attain federal standards by dates specified in federal law. The agency is also responsible for meeting state standards by the earliest date achievable, using reasonably available control measures.

SCAQMD rule development through the 1970s and 1980s resulted in dramatic improvement in SCAB air quality. Nearly all control programs developed through the early 1990s relied on (i) the development and application of cleaner technology; (ii) add-on emission controls, and (iii) uniform CEQA review throughout the SCAB. Industrial emission sources have been significantly reduced by this approach and vehicular emissions have been reduced by technologies implemented at the state level by CARB.

As discussed above, the SCAQMD is the lead agency charged with regulating air quality emission reductions for the entire SCAB. SCAQMD created AQMPs which represent a regional blueprint for achieving healthful air on behalf of the 16 million residents of the SCAB. The 2012 AQMP states, “the remarkable historical improvement in air quality since the 1970’s is the direct result of Southern California’s comprehensive, multiyear strategy of reducing air pollution from all sources as outlined in its AQMPs,” (19).

Emissions of O₃, NO_x, VOC, and CO have been decreasing in the SCAB since 1975 and are projected to continue to decrease through 2020 (20). These decreases result primarily from motor vehicle controls and reductions in evaporative emissions. Although vehicle miles traveled (VMT) in the SCAB continue to increase, NO_x and VOC levels are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with lower-emitting vehicles. NO_x emissions from electric utilities have also decreased due to use of cleaner fuels and renewable energy. O₃ contour maps show that the number of days exceeding the 8-hour NAAQS has generally decreased between 1980 and 2019. For 2019, there was an overall decrease in exceedance days compared with the 1980 period. However, as shown on Table 2-5, O₃ levels have increased in the past three years due to higher temperatures and stagnant weather conditions. Notwithstanding, O₃ levels in the SCAB have decreased substantially over the last 30 years with the current maximum measured concentrations being approximately one-third of concentrations within the late 70’s (21).

TABLE 2-5: SCAB O₃ TREND

Source: 2020 SCAQMD, Historical O₃ Air Quality Trends (1976-2018)

The overall trends of PM₁₀ and PM_{2.5} levels in the air (not emissions) show an overall improvement since 1975. Direct emissions of PM₁₀ have remained somewhat constant in the SCAB and direct emissions of PM_{2.5} have decreased slightly since 1975. Area wide sources (fugitive dust from roads, dust from construction, and other sources) contribute the greatest amount of direct particulate matter emissions.

As with other pollutants, the most recent PM₁₀ statistics show an overall improvement as illustrated in Tables 2-6 and 2-7. During the period for which data are available, the 24-hour national annual average concentration for PM₁₀ decreased by approximately 54%, from 103.7 microgram per cubic meter (µg/m³) in 1988 to 47.5 µg/m³ in 2019 (22). Although the values are below the federal standard, it should be noted that there are days within the year where the concentrations will exceed the threshold. The 24-hour state annual average for emissions for PM₁₀, have decreased by approximately 56% since 1988 (22). Although data in the late 1990's show some variability, this is probably due to the advances in meteorological science rather than a change in emissions. Similar to the ambient concentrations, the calculated number of days above the 24-hour PM₁₀ standards has also shown an overall drop.

TABLE 2-6: SCAB AVERAGE 24-HOUR CONCENTRATION PM₁₀ TREND (BASED ON FEDERAL STANDARD)¹

Source: 2020 CARB, iADAM: Top Four Summary: PM₁₀ 24-Hour Averages (1988-2018)

¹ Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.

TABLE 2-7: SCAB ANNUAL AVERAGE CONCENTRATION PM₁₀ TREND (BASED ON STATE STANDARD)¹

¹ Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.

Tables 2-8 and 2-9 shows the most recent 24-hour average PM_{2.5} concentrations in the SCAB from 1999 through 2019. Overall, the national and state annual average concentrations have decreased by almost 58% and 35% respectively (22). It should be noted that the SCAB is currently designated as nonattainment for the state and federal PM_{2.5} standards.

TABLE 2-8: SCAB 24-HOUR AVERAGE CONCENTRATION PM_{2.5} TREND (BASED ON FEDERAL STANDARD)¹

TABLE 2-9: SCAB ANNUAL AVERAGE CONCENTRATION PM_{2.5} TREND (BASED ON STATE STANDARD)¹

Source: 2020 CARB, iADAM: Top Four Summary: PM_{2.5} 24-Hour Averages (1999-2018)

¹ Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.

While the 2012 AQMP PM₁₀ attainment demonstration and the 2015 associated supplemental SIP submission indicated that attainment of the 24-hour standard was predicted to occur by the end of 2015, it could not anticipate the effect of the ongoing drought on the measured PM_{2.5}.

The 2006 to 2010 base period used for the 2012 attainment demonstration had near-normal rainfall. While the trend of PM_{2.5}-equivalent emission reductions continued through 2015, the severe drought conditions contributed to the PM_{2.5} increases observed after 2012. As a result of the disrupted progress toward attainment of the federal 24-hour PM_{2.5} standard, SCAQMD submitted a request and the EPA approved, in January 2016, a “bump up” to the nonattainment classification from “moderate” to “serious,” with a new attainment deadline as soon as practicable, but not beyond December 31, 2019. As of March 14, 2019, the EPA approved portions of a SIP revision submitted by California to address CAA requirements for the 2006 24-hour PM_{2.5} NAAQS in the Los Angeles-SCAB Serious PM_{2.5} nonattainment area. The EPA also approved 2017 and 2019 motor vehicle emissions budgets for transportation conformity purposes and inter-pollutant trading ratios for use in transportation conformity analyses (23).

In March 2017, the SCAQMD released the Final 2016 AQMP. The 2016 AQMP continues to evaluate current integrated strategies and control measures to meet the NAAQS, as well as explore new and innovative methods to reach its goals. Some of these approaches include utilizing incentive programs, recognizing existing co-benefit programs from other sectors, and developing a strategy with fair-share reductions at the federal, state, and local levels (24). Similar to the 2012 AQMP, the 2016 AQMP incorporates scientific and technological information and planning assumptions, including the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS) and updated emission inventory methodologies for various source categories (18).

The 2022 AQMP is currently being developed by SCAQMD to address the EPA’s strengthened ozone standard. Development of the 2022 AQMP is in its early stages and no formal timeline for completion and adoption is currently known.

The most recent CO concentrations in the SCAB are shown in Table 2-10 (22). CO concentrations in the SCAB have decreased markedly — a total decrease of more about 80% in the peak 8-hour concentration from 1986 to 2012. It should be noted 2012 is the most recent year where 8-hour CO averages and related statistics are available in the SCAB. The number of exceedance days has also declined. The entire SCAB is now designated as attainment for both the state and national CO standards. Ongoing reductions from motor vehicle control programs should continue the downward trend in ambient CO concentrations.

TABLE 2-10: SCAB 8-HOUR AVERAGE CONCENTRATION CO TREND¹

Source: 2020 CARB, iADAM: Top Four Summary: CO 8-Hour Averages (1999-2018)

¹ The most recent year where 8-hour concentration data is available is 2012.

Part of the control process of the SCAQMD's duty to greatly improve the air quality in the SCAB is the uniform CEQA review procedures required by SCAQMD's *CEQA Air Quality Handbook (1993)* (1993 *CEQA Handbook*) (25). The single threshold of significance used to assess Project direct and cumulative impacts has in fact "worked" as evidenced by the track record of the air quality in the SCAB dramatically improving over the course of the past decades. As stated by the SCAQMD, the District's thresholds of significance are based on factual and scientific data and are therefore appropriate thresholds of significance to use for this Project.

The most recent NO₂ data for the SCAB is shown in Tables 2-11 and 2-12 (22). Over the last 50 years, NO₂ values have decreased significantly; the peak 1-hour national and state averages for 2019 is approximately 81% lower than what it was during 1963. The SCAB attained the State 1-hour NO₂ standard in 1994, bringing the entire state into attainment. A new state annual average standard of 0.030 ppm was adopted by CARB in February 2007 (26). The new standard is just barely exceeded in the SCAQMD. NO₂ is formed from NO_x emissions, which also contribute to O₃. As a result, the majority of the future emission control measures will be implemented as part of the overall O₃ control strategy. Many of these control measures will target mobile sources, which account for more than three-quarters of California's NO_x emissions. These measures are expected to bring the SCAQMD into attainment of the state annual average standard.

TABLE 2-12: SCAB 1-HOUR AVERAGE CONCENTRATION NO₂ TREND (BASED ON STATE STANDARD)

Source: 2020 CARB, iADAM: Top Four Summary: CO 1-Hour Averages (1963-2018)

2.9.1 TOXIC AIR CONTAMINANTS (TAC) TRENDS

In 1984, as a result of public concern for exposure to airborne carcinogens, CARB adopted regulations to reduce the amount of TAC emissions resulting from mobile and area sources, such as cars, trucks, stationary products, and consumer products. According to the *Ambient and Emission Trends of Toxic Air Contaminants in California* journal article (27) which was prepared for CARB, results show that between 1990-2012, ambient concentration and emission trends for

the seven TACs responsible for most of the known cancer risk associated with airborne exposure in California have declined significantly (between 1990 and 2012). The seven TACs studied include those that are derived from mobile sources: diesel particulate matter (DPM), benzene (C_6H_6), and 1,3-butadiene (C_4H_6); those that are derived from stationary sources: perchloroethylene (C_2Cl_4) and hexavalent chromium ($Cr(VI)$); and those derived from photochemical reactions of emitted VOCs: formaldehyde (CH_2O) and acetaldehyde (C_2H_4O)². The decline in ambient concentration and emission trends of these TACs are a result of various regulations CARB has implemented to address cancer risk.

MOBILE SOURCE TACs

CARB introduced two programs that aimed at reducing mobile emissions for light and medium duty vehicles through vehicle emissions controls and cleaner fuel. In California, light-duty vehicles sold after 1996 are equipped with California's second-generation On-Board Diagnostic (OBD-II) system. The OBD-II system monitors virtually every component that can affect the emission performance of the vehicle to ensure that the vehicle remains as clean as possible over its entire life and assists repair technicians in diagnosing and fixing problems with the computerized engine controls. If a problem is detected, the OBD-II system illuminates a warning lamp on the vehicle instrument panel to alert the driver. This warning lamp typically contains the phrase "Check Engine" or "Service Engine Soon". The system will also store important information about the detected malfunction so that a repair technician can accurately find and fix the problem. CARB has recently developed similar OBD requirements for heavy-duty vehicles over 14,000 pounds (lbs). CARB's phase II Reformulated Gasoline Regulation (RFG-2), adopted in 1996, also led to a reduction of mobile source emissions. Through such regulations, benzene levels declined 88% from 1990-2012. 1,3-Butadiene concentrations also declined 85% from 1990-2012 as a result of the use of reformulated gasoline and motor vehicle regulations (27).

In 2000, CARB's Diesel Risk Reduction Plan (DRRP) recommended the replacement and retrofit of diesel-fueled engines and the use of ultra-low-sulfur (<15 ppm) diesel fuel. As a result of these measures, DPM concentrations have declined 68% since 2000, even though the state's population increased 31% and the amount of diesel vehicles miles traveled increased 81%, as shown on Exhibit 2-B. With the implementation of these diesel-related control regulations, CARB expects a DPM decline of 71% for 2000-2020.

² It should be noted that ambient DPM concentrations are not measured directly. Rather, a surrogate method using the coefficient of haze (COH) and elemental carbon (EC) is used to estimate DPM concentrations.

EXHIBIT 2-A: DPM AND DIESEL VEHICLE MILES TREND**California Population, Gross State Product (GSP),
Diesel Cancer Risk, Diesel Vehicle-Miles-Traveled (VMT)**

Source: 2020 CARB

DIESEL REGULATIONS

CARB and the Ports of Los Angeles and Long Beach (POLA and POLB) have adopted several iterations of regulations for diesel trucks that are aimed at reducing DPM. More specifically, CARB Drayage Truck Regulation (28), CARB statewide On-road Truck and Bus Regulation (29), and the Ports of Los Angeles and Long Beach Clean Truck Program (CTP) require accelerated implementation of “clean trucks” into the statewide truck fleet (30). In other words, older more polluting trucks will be replaced with newer, cleaner trucks as a function of these regulatory requirements.

Moreover, the average statewide DPM emissions for Heavy Duty Trucks (HDT), in terms of grams of DPM generated per mile traveled, will dramatically be reduced due to the aforementioned regulatory requirements.

Diesel emissions identified in this analysis would therefore overstate future DPM emissions since not all the regulatory requirements are reflected in the modeling.

CANCER RISK TRENDS

Based on information available from CARB, overall cancer risk throughout the SCAB has had a declining trend since 1990. In 1998, following an exhaustive 10-year scientific assessment process, CARB identified particulate matter from diesel-fueled engines as a TAC. The SCAQMD initiated a comprehensive urban toxic air pollution study called the Multiple Air Toxics Exposure Study (MATES). DPM accounts for more than 70% of the cancer risk.

In January 2018, as part of the overall effort to reduce air toxics exposure in the SCAB, SCAQMD began conducting the MATES V Program. MATES V field measurements were conducted at ten fixed sites (the same sites selected for MATES III and IV) to assess trends in air toxics levels. MATES V also included measurements of ultrafine particles (UFP) and black carbon (BC) concentrations, which can be compared to the UFP levels measured in MATES IV (31). The final report for the MATES V study was expected to be available in Fall 2019, however it is not yet available and no definitive date for its release has been provided by SCAQMD.

3 PROJECT AIR QUALITY IMPACT

3.1 INTRODUCTION

This study quantifies air quality emissions generated by construction and operation of the Project and addresses whether the Project conflicts with implementation of the SCAQMD's AQMP and Lead Agency planning regulations. The analysis of Project-generated air emissions determines whether the Project would result in a cumulatively considerable net increase of any criteria pollutant for which the SCAB is in non-attainment under an applicable NAAQS and CAAQS. Additionally, the Project has been evaluated to determine whether the Project would expose sensitive receptors to substantial pollutant concentrations and the impacts of odors. The significance of these potential impacts is described in the following sections.

3.2 STANDARDS OF SIGNIFICANCE

The criteria used to determine the significance of potential Project-related air quality impacts are taken from the *CEQA Guidelines* (14 CCR §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to air quality if it would (2):

- Conflict with or obstruct implementation of the applicable air quality plan.
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard.
- Expose sensitive receptors to substantial pollutant concentrations.
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The SCAQMD has also developed regional significance thresholds for other regulated pollutants, as summarized at Table 3-1 (32). The SCAQMD's *CEQA Air Quality Significance Thresholds* (April 2019) indicate that any projects in the SCAB with daily emissions that exceed any of the indicated thresholds should be considered as having an individually and cumulatively significant air quality impact.

TABLE 3-1: MAXIMUM DAILY REGIONAL EMISSIONS THRESHOLDS

Pollutant	Regional Construction Threshold	Regional Operational Thresholds
NO _x	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM ₁₀	150 lbs/day	150 lbs/day
PM _{2.5}	55 lbs/day	55 lbs/day
SO _x	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Pb	3 lbs/day	3 lbs/day

lbs/day = Pounds Per Day

3.3 MODELS EMPLOYED TO ANALYZE AIR QUALITY

3.3.1 CalEEMod

Land uses such as the Project affect air quality through construction-source and operational-source emissions.

On October 17, 2017, the SCAQMD in conjunction with the California Air Pollution Control Officers Association (CAPCOA) and other California air districts, released the latest version of the CalEEMod Version 2016.3.2. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_x, SO_x, CO, PM₁₀, and PM_{2.5}) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from MMs (33). Accordingly, the latest version of CalEEMod has been used for this Project to determine construction and operational air quality emissions. Output from the model runs for both construction and operational activity are provided in Appendices 3.1 through 3.3.

3.3.2 EMISSION FACTORS MODEL

On August 19, 2019, the EPA approved the 2017 version of the EMISSIONS FACTOR model (EMFAC) web database for use in SIP and transportation conformity analyses. EMFAC2017 is a mathematical model that was developed to calculate emission rates, fuel consumption, and VMT from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by CARB to project changes in future emissions from on-road mobile sources (34). This AQIA utilizes summer, winter, and annual EMFAC2017 emission factors in order to derive vehicle emissions associated with Project operational activities, which vary by season.

Because the EMFAC2017 emission rates are associated with vehicle fuel types while CalEEMod vehicle emission factors are aggregated to include all fuel types for each individual vehicle class, the EMFAC2017 emission rates for different fuel types of a vehicle class are averaged by activity or by population and activity to derive CalEEMod emission factors. The equations applied to obtain CalEEMod vehicle emission factors for each emission type are detailed in CalEEMod User's Guide *Appendix A: Calculation Details for CalEEMod* (35). EMFAC2017 emission rates utilized in this analysis can be found in Appendix 3.4 of this report.

3.4 CONSTRUCTION EMISSIONS

3.4.1 CONSTRUCTION ACTIVITIES

Construction activities associated with the Project would result in emissions of VOCs, NO_x, SO_x, CO, PM₁₀, and PM_{2.5}. Construction related emissions are expected from the following construction activities:

- Demolition/Crushing
- Site Preparation
- Grading
- Building Construction

- Architectural Coating

DEMOLITION ACTIVITIES

Based on information provided by the Project Applicant, the Project would generate approximately 3,432 tons of demolition material.

CRUSHING ACTIVITIES

The Project activities would include on-site crushing of concrete and asphalt pulverizing during demolition activity. Fugitive dust emissions would also be generated through the crushing debris on-site. The U.S. EPA's AP-42 compilation of emission factors available in Chapter 11.19.2-2 were used to estimate fugitive dust from crushing activities. As noted above, it is estimated that approximately 171.61 tons of debris would be crushed per day.

GRADING ACTIVITIES

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called "fugitive emissions". Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). CalEEMod was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Project would require 10,305 cubic yards of cut and 11,382 cubic yards of fill. As such, the Project is anticipated to require 1,077 cubic yards of import.

ON-ROAD TRIPS

Construction generates on-road vehicle emissions from vehicle usage for workers, hauling, and vendors commuting to and from the site. The number of workers, hauling, and vendor trips are presented below in Table 3-2. It should be noted that for Vendor Trips, specifically, CalEEMod only assigns Vendor Trips to the Building Construction phase. Vendor trips would likely occur during all phases of construction. It should be noted that as paving and architectural coating activities overlap with building construction, the vendor trips assigned to building construction activities are assumed the same trips used to cover paving and architectural coating. As such, the CalEEMod defaults for Vendor Trips have been adjusted based on a ratio of the total vendor trips to the number of days of each subphase of activity.

TABLE 3-2: CONSTRUCTION TRIP ASSUMPTIONS

Phase Name	Worker Trips Per Day	Vendor Trips Per Day	Total Hauling Trips
Demolition/Crushing	18	4	339
Site Preparation	18	2	0
Grading	15	5	135
Building Construction	152	48	0
Paving	30	0	0
Architectural Coating	15	0	0

3.4.2 CONSTRUCTION DURATION

For purposes of analysis, construction of Project is expected to commence in October 2021 and be completed in November 2022. The construction schedule utilized in the analysis, shown in Table 3-3, represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as time passes and the analysis year increases due to emission regulations becoming more stringent³. The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per *CEQA Guidelines* (2).

TABLE 3-3: CONSTRUCTION DURATION

Phase Name	Start Date	End Date	Days
Demolition/Crushing	10/04/2021	10/29/2021	20
Site Preparation	10/30/2021	11/12/2021	10
Grading	11/13/2021	12/10/2021	20
Building Construction	12/11/2021	10/28/2022	230
Paving	10/29/2022	11/25/2022	20
Architectural Coating	10/01/2022	11/25/2022	40

3.4.3 CONSTRUCTION EQUIPMENT

A summary of construction equipment by phase is provided at Table 3-4. Consistent with industry standards and typical construction practices, each piece of equipment listed in Table 3-4 will operate up to a total of eight (8) hours per day, or more than two-thirds of the period during which construction activities are allowed pursuant to the City of Long Beach Municipal Code.

TABLE 3-4: CONSTRUCTION EQUIPMENT ASSUMPTIONS (1 OF 2)

Phase Name	Equipment	Amount	Hours Per Day
Demolition	Concrete/Industrial Saws	1	8
	Crushing/Proc. Equipment	1	8
	Excavators	3	8
	Rubber Tired Dozers	2	8
Site Preparation	Crawler Tractors	4	8
	Rubber Tired Dozers	3	8

³ As shown in the CalEEMod User's Guide Version 2016.3.2, Section 4.3 “OFFROAD Equipment” as the analysis year increases, emission factors for the same equipment pieces decrease due to the natural turnover of older equipment being replaced by newer less polluting equipment and new regulatory requirements.

TABLE 3-4: CONSTRUCTION EQUIPMENT ASSUMPTIONS (2 OF 2)

Phase Name	Equipment	Amount	Hours Per Day
Grading	Crawler Tractors	3	8
	Excavators	1	8
	Graders	1	8
	Rubber Tired Dozers	1	8
Building Construction	Cranes	1	8
	Crawler Tractors	3	8
	Forklifts	3	8
	Generator Sets	1	8
	Welders	1	8
Paving	Pavers	2	8
	Paving Equipment	2	8
	Rollers	2	8
Architectural Coating	Air Compressors	1	8

3.4.4 CONSTRUCTION EMISSIONS SUMMARY**IMPACTS WITHOUT MITIGATION**

The estimated maximum daily construction emissions without mitigation are summarized on Table 3-5. Detailed construction model outputs are presented in Appendix 3.1. Under the assumed scenarios, emissions resulting from the Project construction will not exceed thresholds established by the SCAQMD for emissions of any criteria pollutant.

TABLE 3-5: OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITHOUT MITIGATION

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
2021	5.43	61.03	27.80	0.07	11.98	6.59
2022	30.41	36.56	28.00	0.08	3.75	1.95
Winter						
2021	5.44	61.04	27.81	0.07	11.98	6.59
2022	30.50	36.60	27.54	0.08	3.75	1.95
Maximum Daily Emissions	30.50	61.04	28.00	0.08	11.98	6.59
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

3.5 OPERATIONAL EMISSIONS

Operational activities associated with the Project will result in emissions of VOCs, NO_x, SO_x, CO, PM₁₀, and PM_{2.5}. Operational emissions are expected from the following primary sources:

- Area Source Emissions
- Energy Source Emissions
- Mobile Source Emissions
- On-Site Cargo Handling Equipment Emissions

3.5.1 AREA SOURCE EMISSIONS

ARCHITECTURAL COATINGS

Over a period of time the buildings that are part of this Project will require maintenance and will therefore produce emissions resulting from the evaporation of solvents contained in paints, varnishes, primers, and other surface coatings. The emissions associated with architectural coatings were calculated using CalEEMod.

CONSUMER PRODUCTS

Consumer products include, but are not limited to detergents, cleaning compounds, polishes, personal care products, and lawn and garden products. Many of these products contain organic compounds which when released in the atmosphere can react to form ozone and other photochemically reactive pollutants. The emissions associated with use of consumer products were calculated based on defaults provided within CalEEMod.

LANDSCAPE MAINTENANCE EQUIPMENT

Landscape maintenance equipment would generate emissions from fuel combustion and evaporation of unburned fuel. Equipment in this category would include lawnmowers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers used to maintain the landscaping of the Project. The emissions associated with landscape maintenance equipment were calculated based on assumptions provided in CalEEMod.

3.5.2 ENERGY SOURCE EMISSIONS

COMBUSTION EMISSIONS ASSOCIATED WITH NATURAL GAS AND ELECTRICITY

Electricity and natural gas are used by almost every project. Criteria pollutant emissions are emitted through the generation of electricity and consumption of natural gas. However, because electrical generating facilities for the Project area are located either outside the region (state) or offset through the use of pollution credits (RECLAIM) for generation within the SCAB, criteria pollutant emissions from offsite generation of electricity are generally excluded from the evaluation of significance and only natural gas use is considered. The emissions associated with natural gas use were calculated using CalEEMod.

3.5.3 MOBILE SOURCE EMISSIONS

The Project related operational air quality emissions derive primarily from vehicle trips generated by the Project, including employee trips to and from the site and truck trips associated with the proposed uses. As summarized in the *San Francisco Avenue Trip Generation Assessment*, the Project is expected to generate approximately 308 two-way vehicular trips (154 inbound and 154 outbound) which includes 26 two-way truck trips per day (13 inbound and 13 outbound) associated with the General Light Industrial land use and approximately 108 two-way vehicular trips (54 inbound and 54 outbound) which includes 30 two-way truck trips per day (15 inbound and 15 outbound) associated with the Warehouse land use (36).

APPROACH FOR ANALYSIS OF THE PROJECT

To determine emissions from passenger car vehicles, the CalEEMod defaults were utilized for trip length and trip purpose for the proposed Light Industrial and Warehouse use.

For the proposed industrial uses, it is important to note that although the *San Francisco Avenue Trip Generation Assessment* does not break down passenger cars by type, this analysis assumes that passenger cars include Light-Duty-Auto vehicles (LDA), Light-Duty-Trucks (LDT1⁴ & LDT2⁵), Medium-Duty-Vehicles (MDV), Motorcycles (MCY) vehicle types. To account for emissions generated by passenger cars, the following fleet mix was utilized in this analysis:

TABLE 3-6: PASSENGER CAR FLEET MIX

Land Use	Vehicle Type	%
General Light Industrial	LDA	59.34
	LDT1	4.88
	LDT2	22.15
	MDV	13.07
	MCY	0.56
Warehouse	LDA	59.34
	LDT1	4.88
	LDT2	22.15
	MDV	13.07
	MCY	0.56

Note: The Project-specific passenger car fleet mix used in this analysis is based on a proportional split utilizing the default CalEEMod percentages assigned to LDA, LDT1, LDT2, MDV, MCY vehicle types.

⁴ Vehicles under the LDT1 category have a gross vehicle weight rating (GVWR) of less than 6,000 lbs. and equivalent test weight (ETW) of less than or equal to 3,750 lbs.

⁵ Vehicles under the LDT2 category have a GVWR of less than 6,000 lbs. and ETW between 3,751 lbs. and 5,750 lbs.

To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 40 miles⁶ and an assumption of 100% primary trips for the proposed industrial land uses.

In order to be consistent with the *San Francisco Avenue Trip Generation Assessment*, trucks are broken down by truck type. The truck fleet mix is estimated by rationing the trip rates for each truck type based on information provided in the *San Francisco Avenue Trip Generation Assessment*. Heavy trucks are broken down by truck type (or axle type) and are categorized as either Light-Heavy-Duty Trucks (LHDT1⁷ & LHDT2⁸)/2-axle, Medium-Heavy-Duty Trucks (MHDT)/3-axle, and Heavy-Heavy-Duty Trucks (HHDT)/4+-axle. To account for emissions generated by trucks, the following fleet mix was utilized in this analysis:

TABLE 3-7: TRUCK FLEET MIX

Land Use	Vehicle Type	%
General Light Industrial	LHDT1	12.18
	LHDT2	4.80
	MHDT	20.75
	HHDT	62.27
Warehouse	LHDT1	12.18
	LHDT2	4.80
	MHDT	20.75
	HHDT	62.27

Note: Project-specific truck fleet mix is based on the number of trips generated by each truck type (LHDT1, LHDT2, MHDT, and HHDT) relative to the total number of truck trips.

FUGITIVE DUST RELATED TO VEHICULAR TRAVEL

Vehicles traveling on paved roads would be a source of fugitive emissions due to the generation of road dust inclusive of break and tire wear particulates. The emissions estimate for travel on paved roads were calculated using CalEEMod.

3.5.4 ON-SITE CARGO HANDLING EQUIPMENT EMISSIONS

It is common for industrial warehouse buildings to require cargo handling equipment to move empty containers and empty chassis to and from the various pieces of cargo handling equipment that receive and distribute containers. For purposes of analysis, it is assumed that the Project would require on-site operational equipment of up to two (2) 200 horsepower (hp), compressed

⁶ The average trip length for heavy trucks were based on the SCAQMD documents for the implementation of the Facility-Based Mobile Source Measures (FBMSMs) adopted in the 2016 AQMP. SCAQMD's "Preliminary Warehouse Emission Calculations" cites 39.9-mile trip length for heavy-heavy trucks (41). As a conservative measure, a trip length of 40 miles has been utilized for all trucks for the purpose of this analysis (39)

⁷ Vehicles under the LHDT1 category have a GVWR of 8,501 to 10,000 lbs.

⁸ Vehicles under the LHDT2 category have a GVWR of 10,001 to 14,000 lbs.

natural gas or gasoline-powered tractors/loaders/backhoes operating at 4 hours a day for 365 days of the year.

3.5.5 OPERATIONAL EMISSIONS SUMMARY

The estimated operational-source emissions are summarized on Tables 3-8. Detailed operation model outputs for the Project are presented in Appendix 3.2. As shown on Table 3-8, the Project's daily regional emissions from on-going operations will not exceed any of the thresholds of significance.

TABLE 3-8: SUMMARY OF PEAK OPERATIONAL EMISSIONS

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer

3.6 COMPARISON TO ANALYSIS IN *LUE EIR*

This section summarizes the Project's emissions impacts in this AQIA as compared to the emissions totals and impacts that were identified in the *LUE EIR* (1).

3.6.1 *LUE EIR* OPERATIONAL EMISSIONS

Tables 3-9 shows the operational-source emissions associated with buildout of the *LUE EIR* (1).

TABLE 3-9: LUE EIR OPERATIONAL EMISSIONS

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Area Source	7,019.00	2,760.00	14,205.00	15.00	243.00	243.00
Energy Source	112.00	1,185.00	600.00	10.00	68.00	68.00
Mobile Source	1,537.00	16,698.00	3,385.00	33.00	1,673.00	159.00
Total Maximum Daily Emissions	8,668.00	20,644.00	18,190.00	58.00	1,986.00	442.00

3.6.2 CURRENTLY ADOPTED GENERAL PLAN LAND USE OPERATIONAL EMISSIONS

This section summarizes the Project's emissions impacts in this AQIA as compared to the emissions totals that would occur if the site were built under the currently adopted land use. Building 1 is located on a vacant parcel (currently paved for parking, no building). However, Building 2 is currently being utilized for long-term contractor parking. The site is currently occupied by a 19,300-sf building in the northeast corner of the site. Both sites for Buildings 1 and 2 are designated for Light Industrial use. The City's General Plan (December 2019) identifies the existing land use on the site as Neo-Industrial, which allows non-residential development at an intensity of 0.5-1.00 floor to area ratio (FAR) of industrial uses. As such, the existing 6.31-acre site currently assumes between 137,432 sf to 274,864 sf of light industrial uses. The operational emissions are shown on Table 3-10 for the currently adopted land use assuming a lower end of 137,432 sf were developed with a light industrial land use.

TABLE 3-10: CURRENTLY ADOPTED GENERAL PLAN LAND USE OPERATIONAL EMISSIONS (1 OF 2)

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}

3.6.3 COMPARISON OF THE PROPOSED PROJECT TO THE CURRENTLY ADOPTED GENERAL PLAN LAND USE

As shown in Table 3-11, the proposed Project is anticipated to generate slightly more emissions per day for pollutants of VOC, NO_x, CO, SO_x, PM₁₀, and PM_{2.5} when compared to the emissions generated by currently adopted general plan land use assumed for the Project site by the *LUE EIR*.

3.7 LOCALIZED SIGNIFICANCE**BACKGROUND ON LOCALIZED SIGNIFICANCE THRESHOLD (LST) DEVELOPMENT**

The analysis makes use of methodology included in the SCAQMD *Final Localized Significance Threshold Methodology* (LST Methodology). The SCAQMD has established that impacts to air quality are significant if there is a potential to contribute or cause localized exceedances of the

federal and/or state ambient air quality standards (NAAQS/CAAQS). Collectively, these are referred to as Localized Significance Thresholds (LSTs).

The SCAQMD established LSTs in response to the SCAQMD Governing Board's Environmental Justice Initiative I-4⁹. LSTs represent the maximum emissions from a project that would not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard at the nearest residence or sensitive receptor. The SCAQMD states that lead agencies can use the LSTs as another indicator of significance in its air quality impact analyses.

LSTs were developed in response to environmental justice and health concerns raised by the public regarding exposure of individuals to criteria pollutants in local communities. To address the issue of localized significance, the SCAQMD adopted LSTs that show whether a project would cause or contribute to localized air quality impacts and thereby cause or contribute to potential localized adverse health effects. The analysis makes use of methodology included in the *LST Methodology* (37).

APPLICABILITY OF LSTs FOR THE PROJECT

For this Project, the appropriate SRA for the LST analysis is the SCAQMD South Coastal Los Angeles County 3 (SRA 4). LSTs apply to CO, NO₂, PM₁₀, and PM_{2.5}. The SCAQMD produced look-up tables for projects less than or equal to 5 acres in size.

In order to determine the appropriate methodology for determining localized impacts that could occur as a result of Project-related construction, the following process is undertaken:

- Identify the maximum daily on-site emissions that will occur during construction activity:
 - The maximum daily on-site emissions could be based on information provided by the Project Applicant; or
 - The SCAQMD's *Fact Sheet for Applying CalEEMod to Localized Significance Thresholds* and *CalEEMod User's Guide Appendix A: Calculation Details for CalEEMod* can be used to determine the maximum site acreage that is actively disturbed based on the construction equipment fleet and equipment hours as estimated in CalEEMod (38) (35).
- If the total acreage disturbed is less than or equal to 5 acres per day, then the SCAQMD's screening look-up tables are utilized to determine if a Project has the potential to result in a significant impact. The look-up tables establish a maximum daily emissions threshold in lbs/day that can be compared to CalEEMod outputs.
- If the total acreage disturbed is greater than 5 acres per day, then LST impacts may still be conservatively evaluated using the LST look-up tables for a 5-acre disturbance area. Use of the 5-acre disturbance area thresholds can be used to show that even if the daily emissions from all construction activity were emitted within a 5-acre area, and therefore concentrated over a smaller area which would result in greater site adjacent concentrations, the impacts would still be less than significant if the applicable 5-acre thresholds are utilized.

⁹ The purpose of SCAQMD's Environmental Justice program is to ensure that everyone has the right to equal protection from air pollution and fair access to the decision-making process that works to improve the quality of air within their communities. Further, the SCAQMD defines Environmental Justice as "...equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution."

- The *LST Methodology* presents mass emission rates for each SRA, project sizes of 1, 2, and 5 acres, and nearest receptor distances of 25, 50, 100, 200, and 500 meters. For project sizes between the values given, or with receptors at distances between the given receptors, the methodology uses linear interpolation to determine the thresholds.

EMISSIONS CONSIDERED

Based on SCAQMD's *LST Methodology*, emissions for concern during construction activities are on-site NO_x, CO, PM_{2.5}, and PM₁₀. The *LST Methodology* clearly states that "off-site mobile emissions from the Project should not be included in the emissions compared to LSTs (39)." As such, for purposes of the construction LST analysis, only emissions included in the CalEEMod "on-site" emissions outputs were considered.

MAXIMUM DAILY DISTURBED-ACREAGE

As a conservative measure, it is assumed that the entire Project site (12.69 acres) can be actively disturbed during construction of the site. In CalEEMod, the Total Acres Graded (TAG) field represents the cumulative distance traversed on the property by the grading equipment. In order to properly grade a piece of land, multiple passes with grading equipment may be required. So even though the lot size is a fixed number of acres, the TAG could be an order of magnitude higher than the footprint of the lot (35). Total Acres Graded (TAG) is a function of the maximum acreage disturbed per day times the number of days of the subphase of construction. As such, the TAG field in CalEEMod has been revised to 127 acres (12.69 acres per day x 10 days) for site preparation and 381 acres (12.69 acres per day x 30 days) for site preparation¹⁰.

RECEPTORS

As previously stated, LSTs represent the maximum emissions from a project that would not cause or contribute to an exceedance of the most stringent applicable NAAQS and CAAQS at the nearest residence or sensitive receptor. Receptor locations are off-site locations where individuals may be exposed to emissions from Project activities.

Some people are especially sensitive to air pollution and are given special consideration when evaluating air quality impacts from projects. These groups of people include children, the elderly, and individuals with pre-existing respiratory or cardiovascular illness. Structures that house these persons or places where they gather are defined as "sensitive receptors". These structures typically include uses such as residences, hotels, and hospitals where an individual can remain for 24 hours. Consistent with the *LST Methodology*, the nearest land use where an individual could remain for 24 hours to the Project site will be used to determine construction and operational air quality impacts for emissions of PM₁₀ and PM_{2.5}, since PM₁₀ and PM_{2.5} thresholds are based on a 24-hour averaging time.

LSTs apply, even for non-sensitive land uses, consistent with *LST Methodology* and SCAQMD guidance. Per the *LST Methodology*, commercial and industrial facilities are not included in the definition of sensitive receptor because employees and patrons do not typically remain onsite

¹⁰ CalEEMod does not provide a "Total Acres Graded" field for Demolition, Building Construction, Paving, or Architectural Coating activities.

for a full 24 hours but are typically onsite for 8 hours or less. However, *LST Methodology* explicitly states that “LSTs based on shorter averaging periods, such as the NO₂ and CO LSTs, could also be applied to receptors such as industrial or commercial facilities since it is reasonable to assume that a worker at these sites could be present for periods of one to eight hours (39).” Therefore, any adjacent land use where an individual could remain for 1 or 8-hours, that is located at a closer distance to the Project site than the receptor used for PM₁₀ and PM_{2.5} analysis, must be considered to determine construction and operational LST air impacts for emissions of NO₂ and CO since these pollutants have an averaging time of 1 and 8-hours.

PROJECT-RELATED RECEPTORS

Receptors in the Project study area are described below and shown on Exhibit 3-A. Localized air quality impacts were evaluated at sensitive receptor land uses nearest the Project site. All distances are measured from the Project site boundary to the outdoor living areas (e.g., backyards) or at the building façade, whichever is closer to the Project site. The selection of receptor locations is based on Federal Highway Administration (FHWA) guidelines and is consistent with additional guidance provided by Caltrans and the Federal Transit Administration (FTA).

- R1: Location R1 represents the Travel Eagle Inn Motel at 809 West Pacific Coast Highway, approximately 1,577 feet north of the Project site. Receptor R1 is placed at the building façade.
- R2: Location R2 represents the existing multi-family residential home at 461 West Cowles Street, approximately 1,613 feet east of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receptor R2 is placed at the building façade.
- R3: Location R3 represents the existing single-family residential home at 1153 North Loma Vista Drive, approximately 936 feet southeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receptor R3 is placed at the building façade.
- R4: Location R4 represents the Drake/Chavez Soccer Fields at 903 Fairbanks Avenue, approximately 1,064 feet south of the Project site. Receptor R4 is placed at the field boundary.
- R5: Location R5 represents the Urban Element Design, Inc. manufacturing facility at 806 West 14th Street, located approximately 58 feet east of the Project site. Receptor R5 is placed at the approximate location of where the future building façade is anticipated.

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Project’s potential to cause an individual a cumulatively significant impact. The nearest land use where an individual could remain for 24 hours to the Project site has been used to determine localized construction and operational air quality impacts for emissions of PM₁₀ and PM_{2.5} (since PM₁₀ and PM_{2.5} thresholds are based on a 24-hour averaging time). The nearest receptor used for evaluation of localized impacts of PM₁₀ and PM_{2.5} is represented by the existing single-family residential home located at 1153 North Loma Vista Drive, located approximately 936 feet (285 meters) north of the Project site.

EXHIBIT 3-A: RECEPTOR LOCATIONS

- LEGEND:**
-  N
 -  Receptor Locations
 -  Distance from receptor to Project site boundary (in feet)

As previously stated, and consistent with *LST Methodology*, the nearest industrial/commercial use to the Project site is used to determine construction and operational LST air impacts for emissions of NO_x and CO as the averaging periods for these pollutants are shorter (8 hours or less) and it is reasonable to assume that an individual could be present at these sites for periods of one to 8 hours. The nearest receptor used for evaluation of localized impacts of NO_x and CO is represented by the Urban Element Design, Inc. manufacturing facility at 806 West 14th Street, located approximately 58 feet (18 meters) south of the Project site.

It should be noted that the *LST Methodology* explicitly states that “*It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters (40).*” As such a 25-meter receptor distance will be used for evaluation of localized NO_x and CO.

3.8 CONSTRUCTION-SOURCE EMISSIONS LST ANALYSIS

3.8.1 LOCALIZED THRESHOLDS FOR CONSTRUCTION ACTIVITY

Although the total acreage disturbed is more than 5 acres per day for construction activities, the *LST Methodology* provides look-up tables for sites with an area with daily disturbance of 5 acres or less. For projects that exceed 5 acres, the 5-acre LST look-up tables can be used as a screening tool to determine which pollutants require additional detailed analysis. This approach is conservative as it assumes that all on-site emissions associated with the Project would occur within a concentrated 5-acre area. This screening method would therefore over-predict potential localized impacts, because by assuming that on-site construction activities are occurring over a smaller area, the resulting concentrations of air pollutants are more highly concentrated once they reach the smaller site boundary than they would be for activities if they were spread out over a larger surface area. On a larger site, the same amount of air pollutants generated would disperse over a larger surface area and would result in a lower concentration once emissions reach the Project-site boundary. As such, LSTs for a 5-acre site during construction are used as a screening tool to determine if further detailed analysis is required. The thresholds used in for the construction-source LST analysis are presented below in Table 3-12.

TABLE 3-12: MAXIMUM DAILY LOCALIZED CONSTRUCTION EMISSIONS THRESHOLDS

Pollutant	Construction Localized Thresholds
NO _x	123 lbs/day
CO	1,530 lbs/day
PM ₁₀	120 lbs/day
PM _{2.5}	62 lbs/day

3.8.2 CONSTRUCTION-SOURCE LOCALIZED EMISSIONS

IMPACTS WITHOUT MITIGATION

Table 3-13 identifies the localized impacts at the nearest receptor location in the vicinity of the Project. For analytical purposes, emissions associated with peak demolition/crushing, site

preparation, and grading activities are considered for purposes of LSTs since these phases represents the maximum localized emissions that would occur. Any other construction phases of development that overlap would result in lesser emissions and consequently lesser impacts than what is disclosed herein. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs for emissions of any criteria pollutant.

TABLE 3-13: LOCALIZED CONSTRUCTION-SOURCE EMISSIONS – WITHOUT MITIGATION

On-Site Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Demolition/Crushing				
Maximum Daily Emissions	34.94	25.90	3.28	1.89
SCAQMD Localized Threshold	123	1,530	120	62
Threshold Exceeded?	NO	NO	NO	NO
Site Preparation				
Maximum Daily Emissions	60.79	21.85	11.76	6.53
SCAQMD Localized Threshold	123	1,530	120	62
Threshold Exceeded?	NO	NO	NO	NO
Grading				
Maximum Daily Emissions	39.95	16.38	6.03	3.00
SCAQMD Localized Threshold	123	1,530	120	62
Threshold Exceeded?	NO	NO	NO	NO

3.9 OPERATIONAL-SOURCE EMISSIONS LST ANALYSIS

The Project site is located on an approximately 6.31-acre parcel. As noted previously, the *LST Methodology* provides look-up tables for sites with an area with daily disturbance of 5 acres or less. For projects that exceed 5 acres, the 5-acre LST look-up tables can be used as a screening tool to determine whether pollutants require additional detailed analysis. This approach is conservative as it assumes that all on-site emissions associated with the project would occur within a concentrated 5-acre area. This screening method would therefore over-predict potential localized impacts, because by assuming that on-site operational activities are occurring over a smaller area, the resulting concentrations of air pollutants are more highly concentrated once they reach the smaller site boundary than they would be for activities if they were spread out over a larger surface area. On a larger site, the same amount of air pollutants generated would disperse over a larger surface area and would result in a lower concentration once emissions reach the project-site boundary. As such, LSTs for a 5-acre site during operations are used as a screening tool to determine if further detailed analysis is required.

The LST analysis generally includes on-site sources (area, energy, mobile, and on-site cargo handling equipment – are previously discussed in Section 3.5 of this report). However, it should be noted that the CalEEMod outputs do not separate on-site and off-site emissions from mobile

sources. In an effort to establish a maximum potential impact scenario for analytic purposes, the emissions shown on Table 3-15 represent all on-site Project-related stationary sources and 5% of the Project-related mobile sources. Considering that the trip length used in CalEEMod for the Project is approximately 16.6 miles for passenger cars and 40.0 miles for all trucks, 5% of this total would represent an on-site travel distance of approximately 0.8 mile for passenger cars and 2 miles for trucks. It should be noted that the longest on-site distance is roughly 0.5 miles for passenger cars and trucks. As such, the 5% assumption is conservative and would tend to overstate the actual impact because it is not likely that a passenger car or truck would drive 0.8 mile or 2 miles on the site, respectively. Modeling based on these assumptions demonstrates that even within broad encompassing parameters, Project operational-source emissions would not exceed applicable LSTs.

3.9.1 LOCALIZED THRESHOLDS FOR OPERATIONAL ACTIVITY

As previously stated, LSTs for a 5-acre site during operations are used as a screening tool to determine if further detailed analysis is required.

TABLE 3-14: MAXIMUM DAILY LOCALIZED OPERATIONAL EMISSIONS THRESHOLDS

Pollutant	Operational Localized Thresholds
NO _x	123 lbs/day
CO	1,530 lbs/day
PM ₁₀	29 lbs/day
PM _{2.5}	15 lbs/day

3.9.2 OPERATIONAL-SOURCE LOCALIZED EMISSIONS

As shown on Table 3-15 operational emissions would not exceed the LST thresholds for the nearest sensitive receptor. Therefore, the Project would have a less than significant localized impact during operational activity.

TABLE 3-15: LOCALIZED SIGNIFICANCE SUMMARY OF OPERATIONS

On-Site Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Maximum Daily Emissions	3.52	2.56	0.38	0.18
SCAQMD Localized Threshold	123	1,530	29	15
Threshold Exceeded?	NO	NO	NO	NO

3.10 CO “HOT SPOT” ANALYSIS

As discussed below, the Project would not result in potentially adverse CO concentrations or “hot spots.” Further, detailed modeling of Project-specific CO “hot spots” is not needed to reach this

conclusion. An adverse CO concentration, known as a “hot spot”, would occur if an exceedance of the state one-hour standard of 20 ppm or the eight-hour standard of 9 ppm were to occur.

It has long been recognized that CO hotspots are caused by vehicular emissions, primarily when idling at congested intersections. In response, vehicle emissions standards have become increasingly stringent in the last twenty years. Currently, the allowable CO emissions standard in California is a maximum of 3.4 grams/mile for passenger cars (there are requirements for certain vehicles that are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of increasingly sophisticated and efficient emissions control technologies, CO concentration in the SCAB is now designated as attainment.

To establish a more accurate record of baseline CO concentrations affecting the SCAB, a CO “hot spot” analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods. This “hot spot” analysis did not predict any violation of CO standards, as shown on Table 3-16.

TABLE 3-16: CO MODEL RESULTS

Intersection Location	CO Concentrations (ppm)		
	Morning 1-hour	Afternoon 1-hour	8-hour
Wilshire Boulevard/Veteran Avenue	4.6	3.5	3.7
Sunset Boulevard/Highland Avenue	4	4.5	3.5
La Cienega Boulevard/Century Boulevard	3.7	3.1	5.2
Long Beach Boulevard/Imperial Highway	3	3.1	8.4

Notes: Federal 1-hour standard is 35 ppm, and the deferral 8-hour standard is 9.0 ppm.

Based on the SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (*1992 CO Plan*), peak CO concentrations in the SCAB were a result of unusual meteorological and topographical conditions and not a result of traffic volumes and congestion at a particular intersection. As evidence of this, for example, 8.4 ppm 8-hr CO concentration measured at the Long Beach Blvd. and Imperial Hwy. intersection (highest CO generating intersection within the “hot spot” analysis), only 0.7 ppm was attributable to the traffic volumes and congestion at this intersection; the remaining 7.7 ppm were due to the ambient air measurements at the time the 2003 AQMP was prepared (41). In contrast, an adverse CO concentration, known as a “hot spot”, would occur if an exceedance of the state one-hour standard of 20 parts per million (ppm) or the eight-hour standard of 9 ppm were to occur.

The ambient 1-hr and 8-hr CO concentration within the Project study area is estimated to be 3.0 ppm and 2.1 ppm, respectively (data from South Coastal Los Angeles County 3 station for 2019). Therefore, even if the traffic volumes for the proposed Project were double or even triple of the traffic volumes generated at the Long Beach Blvd. and Imperial Hwy. intersection, coupled with the on-going improvements in ambient air quality, the Project would not be capable of resulting in a CO “hot spot” at any study area intersections.

Similar considerations are also employed by other Air Districts when evaluating potential CO concentration impacts. More specifically, the Bay Area Air Quality Management District (BAAQMD) concludes that under existing and future vehicle emission rates, a given project would have to increase traffic volumes at a single intersection by more than 44,000 vehicles per hour (vph)—or 24,000 vph where vertical and/or horizontal air does not mix—in order to generate a significant CO impact (42). Traffic volumes generating the CO concentrations for the “hot spot” analysis is shown on Table 3-17. The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue, which has a daily traffic volume of approximately 100,000 vph and AM/PM traffic volumes of 8,062 vph and 7,719 vph respectively (41). The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm; this indicates that, should the daily traffic volume increase four times to 400,000 vehicles per day, CO concentrations ($4.6 \text{ ppm} \times 4 = 18.4 \text{ ppm}$) would still not likely exceed the most stringent 1-hour CO standard (20.0 ppm)¹¹.

TABLE 3-17: TRAFFIC VOLUMES

Intersection Location	Peak Traffic Volumes (vph)				
	Eastbound (AM/PM)	Westbound (AM/PM)	Southbound (AM/PM)	Northbound (AM/PM)	Total (AM/PM)
Wilshire Boulevard/Veteran Avenue	4,954/2,069	1,830/3,317	721/1,400	560/933	8,062/7,719
Sunset Boulevard/Highland Avenue	1,417/1,764	1,342/1,540	2,304/1,832	1,551/2,238	6,614/5,374
La Cienega Boulevard/Century Boulevard	2,540/2,243	1,890/2,728	1,384/2,029	821/1,674	6,634/8,674
Long Beach Boulevard/Imperial Highway	1,217/2,020	1,760/1,400	479/944	756/1,150	4,212/5,514

3.11 AQMP

The Project site is located within the SCAB, which is characterized by relatively poor air quality. The SCAQMD has jurisdiction over an approximately 10,743 square-mile area consisting of the four-county Basin and the Los Angeles County and Riverside County portions of what use to be referred to as the Southeast Desert Air Basin. In these areas, the SCAQMD is principally responsible for air pollution control, and works directly with the SCAG, county transportation commissions, local governments, as well as state and federal agencies to reduce emissions from stationary, mobile, and indirect sources to meet state and federal ambient air quality standards.

Currently, these state and federal air quality standards are exceeded in most parts of the SCAB. In response, the SCAQMD has adopted a series of AQMPs to meet the state and federal ambient air quality standards. AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy.

In March 2017, the SCAQMD released the *Final 2016 AQMP (2016 AQMP)*. The 2016 AQMP continues to evaluate current integrated strategies and control measures to meet the NAAQS, as

¹¹ Based on the ratio of the CO standard (20.0 ppm) and the modeled value (4.6 ppm)

well as explore new and innovative methods to reach its goals. Some of these approaches include utilizing incentive programs, recognizing existing co-benefit programs from other sectors, and developing a strategy with fair-share reductions at the federal, state, and local levels (43). Similar to the 2012 AQMP, the 2016 AQMP incorporates scientific and technological information and planning assumptions, including the 2016-2040 *Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS)*, a planning document that supports the integration of land use and transportation to help the region meet the federal CAA requirements (18). The Project's consistency with the AQMP will be determined using the 2016 AQMP as discussed below.

Criteria for determining consistency with the AQMP are defined in Chapter 12, Section 12.2, and Section 12.3 of the 1993 *CEQA Handbook* (44). These indicators are discussed below:

3.11.1 CONSISTENCY CRITERION No. 1

The proposed Project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

The violations that Consistency Criterion No. 1 refer to are the CAAQS and NAAQS. CAAQS and NAAQS violations would occur if regional or localized significance thresholds were exceeded.

Construction Impacts – Consistency Criterion 1

Consistency Criterion No. 1 refers to violations of the CAAQS and NAAQS. CAAQS and NAAQS violations would occur if regional or localized significance thresholds were exceeded. As evaluated, the Project's regional and localized construction-source emissions would not exceed applicable regional significance thresholds. As such, a less than significant impact is expected.

Operational Impacts – Consistency Criterion 1

As evaluated, the Project would not exceed the applicable regional and localized significance thresholds for operational activity. The Project would not result in any new or more serve impacts with respect to this threshold. Therefore, the Project would not conflict with the AQMP according to this criterion.

On the basis of the preceding discussion, the Project is determined to be consistent with the first criterion.

3.11.2 CONSISTENCY CRITERION No. 2

The Project will not exceed the assumptions in the AQMP based on the years of Project build-out phase.

The 2016 AQMP demonstrates that the applicable ambient air quality standards can be achieved within the timeframes required under federal law. Growth projections from local general plans adopted by cities in the district are provided to the SCAG, which develops regional growth forecasts, which are then used to develop future air quality forecasts for the AQMP. Development

consistent with the growth projections in City of Long Beach General Plan is considered to be consistent with the AQMP.

Construction Impacts – Consistency Criterion 2

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. Irrespective of the site's land use designation, development of the site to its maximum potential would likely occur, with disturbance of the entire site occurring during construction activities. As such, when considering that no emissions thresholds will be exceeded, a less than significant impact would result.

Operational Impacts – Consistency Criterion 2

As previously stated, the Project site is designated for Neo-Industrial uses. Neo-Industrial designation encourages the location, evolution and retention of restricted light industrial activities associated with innovative start-up businesses and creative design offices in the arts, engineering, sciences, technology, media, education, information industries, among others (45). The Project is proposed to consist of two buildings totaling 124,972 sf of general light industrial use. With Building 1 at 63,419 sf and Building 2 at 61,553 sf, which is consistent with the site's General Plan land use designation. Since the Project's proposed land uses are consistent with the General Plan and as the Project's construction and operational-source air pollutant emissions would not exceed the regional or localized significance thresholds, the Project is determined to be consistent with the second criterion.

It is important to note that the *LUE EIR* does not quantify emissions for specific land use projects. As shown in Section 3.6 of this AQIA, operational-source emissions were calculated for the Project site based on the other currently approved land use designation identified in the *LUE EIR*. The proposed Project emissions are considered to be less than the emissions anticipated by the *LUE EIR* for the Project site for General Plan Buildout.

On the basis of the preceding discussion, the Project is determined to be consistent with the second criterion.

AQMP CONSISTENCY CONCLUSION

The Project would not have the potential to result in or cause NAAQS or CAAQS violations. Although the Project's proposed uses are not consistent with the General Plan land use designation, as the Project would not exceed the regional or localized construction and operational thresholds, the Project's development intensity is consistent with the development intensities allowed within the General Plan as previously stated. As such, the Project is considered to be consistent with the AQMP.

3.12 POTENTIAL IMPACTS TO SENSITIVE RECEPTORS

The potential impact of Project-generated air pollutant emissions at sensitive receptors has also been considered. Results of the LST analysis indicate that the Project will not exceed the

SCAQMD localized significance thresholds during construction. Therefore, sensitive receptors would not be exposed to substantial pollutant concentrations during Project construction.

Additionally, the Project will not exceed the SCAQMD localized significance thresholds during operational activity. Further Project traffic would not create or result in a CO “hotspot.” Therefore, sensitive receptors would not be exposed to substantial pollutant concentrations as the result of Project operations.

3.12.1 FRIANT RANCH CASE

In December 2018, in the case of *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, California Supreme Court held that an EIR's air quality analysis must meaningfully connect the identified air quality impacts to the human health consequences of those impacts, or meaningfully explain why that analysis cannot be provided. As noted in the *Brief of Amicus Curiae* by the SCAQMD in the Friant Ranch case (April 6, 2015, Appendix 3.5), SCAQMD has among the most sophisticated air quality modeling and health impact evaluation capability of any of the air districts in the State, and thus it is uniquely situated to express an opinion on how lead agencies should correlate air quality impacts with specific health outcomes (46).

The SCAQMD discusses that it may be infeasible to quantify health risks caused by projects similar to the proposed Project, due to many factors. It is necessary to have data regarding the sources and types of air toxic contaminants, location of emission points, velocity of emissions, the meteorology and topography of the area, and the location of receptors (worker and residence) (46). The *Brief* states that it may not be feasible to perform a health risk assessment for airborne toxics that will be emitted by a generic industrial building that was built on "speculation" (i.e., without knowing the future tenant(s))¹² (46). Even where a health risk assessment can be prepared, however, the resulting maximum health risk value is only a calculation of risk—it does not necessarily mean anyone will contract cancer as a result of the Project (46). The *Brief* also cites the author of the CARB methodology, which reported that a PM_{2.5} methodology is not suited for small projects and may yield unreliable results (46). Similarly, SCAQMD staff does not currently know of a way to accurately quantify O₃-related health impacts caused by NO_x or VOC emissions from relatively small projects, due to photochemistry and regional model limitations (46). The *Brief* concludes, with respect to the Friant Ranch EIR, that although it may have been technically possible to plug the data into a methodology, the results would not have been reliable or meaningful (46).

On the other hand, for extremely large regional projects (unlike the proposed Project), the SCAQMD states that it has been able to correlate potential health outcomes for very large emissions sources – as part of their rulemaking activity, specifically 6,620 lbs./day of NO_x and 89,180 lbs./day of VOC were expected to result in approximately 20 premature deaths per year and 89,947 school absences due to O₃ (46).

¹² It should also be noted that the actual occurrence of specific health conditions is based on numerous other factors that are infeasible to quantify, such as an individual's genetic predisposition, diet, exercise regiment, stress, and other behavioral characteristics.

The proposed Project does not generate anywhere near 6,620 lbs/day of NO_x or 89,190 lbs/day of VOC emissions. The proposed Project would generate up to 61.04 lbs/day of NO_x during construction and 17.48 lbs/day of NO_x during operations (0.92% and 0.26% of 6,620 lbs/day, respectively). Additionally, the proposed Project would also generate a maximum of 30.50 lbs/day of VOC emissions during construction and 4.52 lbs/day of VOC emissions during operations (0.03% and 0.01% of 89,190 lbs/day, respectively). Therefore, the proposed Project's emissions are not sufficiently high enough to use a regional modeling program to correlate health effects on a basin-wide level.

Notwithstanding, this AQIA does evaluate the proposed Project's localized impact to air quality for emissions of CO, NO_x, PM₁₀, and PM_{2.5} by comparing the Proposed Project's on-site emissions to the SCAQMD's applicable LST thresholds. As evaluated in this AQIA, the proposed Project would not result in emissions that exceeded the SCAQMD's LSTs. Therefore, the proposed Project would not be expected to exceed the most stringent applicable federal or state ambient air quality standards for emissions of CO, NO_x, PM₁₀, and PM_{2.5}.

3.13 ODORS

The potential for the Project to generate objectionable odors has also been considered. Land uses generally associated with odor complaints include:

- Agricultural uses (livestock and farming)
- Wastewater treatment plants
- Food processing plants
- Chemical plants
- Composting operations
- Refineries
- Landfills
- Dairies
- Fiberglass molding facilities

The Project does not contain land uses typically associated with emitting objectionable odors. Potential odor sources associated with the proposed Project may result from construction equipment exhaust and the application of asphalt and architectural coatings during construction activities and the temporary storage of typical solid waste (refuse) associated with the proposed Project's (long-term operational) uses. Standard construction requirements would minimize odor impacts from construction. The construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of the respective phase of construction and is thus considered less than significant. It is expected that Project-generated refuse would be stored in covered containers and removed at regular intervals in compliance with the solid waste regulations. The proposed Project would also be required to comply with SCAQMD Rule 402 to prevent occurrences of public nuisances. Therefore, odors associated with the proposed Project construction and operations would be less than significant and no mitigation is required (47).

3.14 CUMULATIVE IMPACTS

As previously shown in Table 2-3, the CAAQS designate the Project site as nonattainment for O₃, PM₁₀, and PM_{2.5} while the NAAQS designates the Project site as nonattainment for O₃ and PM_{2.5}.

The SCAQMD has published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution* (48). In this report the SCAQMD clearly states (Page D-3):

“...the SCAQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for TAC emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.

Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.”

Therefore, this analysis assumes that individual projects that do not generate operational or construction emissions that exceed the SCAQMD’s recommended daily thresholds for project-specific impacts would also not cause a cumulatively considerable increase in emissions for those pollutants for which SCAB is in nonattainment, and, therefore, would not be considered to have a significant, adverse air quality impact. Alternatively, individual project-related construction and operational emissions that exceed SCAQMD thresholds for project-specific impacts would be considered cumulatively considerable.

CONSTRUCTION IMPACTS

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that Project construction-source air pollutant emissions would not result in exceedances of regional thresholds. Therefore, Project construction-source emissions would be considered less than significant on a project-specific and cumulative basis.

OPERATIONAL IMPACTS

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that Project operational-source air pollutant emissions would not result in exceedances of

regional thresholds. Therefore, Project operational-source emissions would be considered less than significant on a project-specific and cumulative basis.

MAPS AND TABLES OF AREA DESIGNATIONS FOR STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS

[This page intentionally left blank]

APPENDIX C

MAPS AND TABLES OF AREA DESIGNATIONS FOR STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS

This attachment fulfills the requirement of Health and Safety Code section 40718 for CARB to publish maps that identify areas where one or more violations of any State ambient air quality standard (State standard) or national ambient air quality standard (national standard) have been measured. The national standards are those promulgated under section 109 of the federal Clean Air Act (42 U.S.C. 7409).

This attachment is divided into three parts. The first part comprises a table showing the levels, averaging times, and measurement methods for each of the State and national standards. This is followed by a section containing maps and tables showing the area designations for each pollutant for which there is a State standard in the California Code of Regulations, title 17, section 70200. The last section contains maps and tables showing the most current area designations for the national standards.

Ambient Air Quality Standards

(Updated 5/4/16)

Pollutant	Averaging Time	California Standards ¹		National Standards ²		
		Concentration ³	Method ⁴	Primary ^{3,5}	Secondary ^{3,6}	Method ⁷
Ozone (O ₃) ⁸	1 Hour	0.09 ppm (180 µg/m³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m³)		0.070 ppm (137 µg/m³)		
Respirable Particulate Matter (PM10) ⁹	24 Hour	50 µg/m³	Gravimetric or Beta Attenuation	150 µg/m³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m³		—		
Fine Particulate Matter (PM2.5) ⁹	24 Hour	—	—	35 µg/m³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m³	Gravimetric or Beta Attenuation	12.0 µg/m³	15 µg/m³	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m³)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m³)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m³)		9 ppm (10 mg/m³)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m³)		—	—	
Nitrogen Dioxide (NO ₂) ¹⁰	1 Hour	0.18 ppm (339 µg/m³)	Gas Phase Chemiluminescence	100 ppb (188 µg/m³)	—	Gas Phase Chemiluminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m³)		0.053 ppm (100 µg/m³)	Same as Primary Standard	
Sulfur Dioxide (SO ₂) ¹¹	1 Hour	0.25 ppm (655 µg/m³)	Ultraviolet Fluorescence	75 ppb (196 µg/m³)	—	Ultraviolet Fluorescence; Spectrophotometry (Pararosaniline Method)
	3 Hour	—		—	0.5 ppm (1300 µg/m³)	
	24 Hour	0.04 ppm (105 µg/m³)		0.14 ppm (for certain areas) ¹¹	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas) ¹¹	—	
Lead ^{12,13}	30 Day Average	1.5 µg/m³	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m³ (for certain areas) ¹²	Same as Primary Standard	
	Rolling 3-Month Average	—		0.15 µg/m³		
Visibility Reducing Particles ¹⁴	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	No National Standards		
Sulfates	24 Hour	25 µg/m³	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m³)	Ultraviolet Fluorescence			
Vinyl Chloride ¹²	24 Hour	0.01 ppm (26 µg/m³)	Gas Chromatography			

See footnotes on next page ...

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, and particulate matter (PM₁₀, PM_{2.5}, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than one. For PM_{2.5}, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent measurement method which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.
8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
9. On December 14, 2012, the national annual PM_{2.5} primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. The existing national 24-hour PM_{2.5} standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM₁₀ standards (primary and secondary) of 150 µg/m³ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
11. On June 2, 2010, a new 1-hour SO₂ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
12. The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
14. In 1989, the CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

[This page intentionally left blank]

Area Designations for the State Ambient Air Quality Standards

The following maps and tables show the area designations for each pollutant with a State standard set forth in the California Code of Regulations, title 17, section 60200. Each area is identified as attainment, nonattainment, nonattainment-transitional, or unclassified for each pollutant, as shown below:

Attainment	A
Nonattainment	N
Nonattainment-Transitional	NA-T
Unclassified	U

In general, CARB designates areas by air basin for pollutants with a regional impact and by county for pollutants with a more local impact. However, when there are areas within an air basin or county with distinctly different air quality deriving from sources and conditions not affecting the entire air basin or county, CARB may designate a smaller area. Generally, when boundaries of the designated area differ from the air basin or county boundaries, the description of the specific area is referenced at the bottom of the summary table.

FIGURE 1

Area Designations for the National Ambient Air Quality Standards

The following maps and tables show the area designations for each pollutant with a national ambient air quality standard. Additional information about the federal area designations is available on the U.S. EPA website:

<https://www.epa.gov/green-book>

Over the last several years, U.S. EPA has been reviewing the levels of the various national standards. The agency has already promulgated new standard levels for some pollutants and is considering revising the levels for others. Information about the status of these reviews is available on the U.S. EPA website:

<https://www.epa.gov/criteria-air-pollutants>

Designation Categories

Suspended Particulate Matter (PM₁₀). The U.S. EPA uses three categories to designate areas with respect to PM₁₀:

- Attainment
- Nonattainment
- Unclassifiable

Ozone, Fine Suspended Particulate Matter (PM_{2.5}), Carbon Monoxide (CO), and Nitrogen Dioxide (NO₂). The U.S. EPA uses two categories to designate areas with respect to these standards:

- Nonattainment
- Unclassifiable/Attainment

The national 1-hour ozone standard was revoked effective June 15, 2005, and the area designations map reflects the 2015 national 8-hour ozone standard of 0.070 ppm. Original designations were finalized on August 3, 2018.

On December 14, 2012, the U.S. EPA established a new national annual primary PM_{2.5} standard of 12.0 µg/m³. New area designations reflecting this revised standard became final in December 2014. The current designation map reflects the most recently revised (2012) annual average standard of 12.0 µg/m³ as well as the 24-hour standard of 35 µg/m³, revised in 2006.

On January 22, 2010, the U.S. EPA established a new national 1-hour NO₂ standard of 100 parts per billion (ppb) and retained the annual average standard of 53 ppb. Designations for the primary NO₂ standard became effective on February 29, 2012. All areas of California meet this standard.

Sulfur Dioxide (SO₂). The U.S. EPA uses three categories to designate areas with respect to the 24-hour and annual average sulfur dioxide standards. These designation categories are:

- Nonattainment,
- Unclassifiable, and
- Attainment/Unclassifiable.

On June 2, 2010, the U.S. EPA established a new primary 1-hour SO₂ standard of 75 parts per billion (ppb). At the same time, U.S. EPA revoked the 24-hour and annual

average standards. Area designations for the 1-hour SO₂ standard were finalized on December 21, 2017 and are reflected in the area designations map.

Lead (particulate). The U.S. EPA promulgated a new rolling 3-month average lead standard in October 2008 of 0.15 µg/m³. Designations were made for this standard in November 2010.

Designation Areas

From time to time, the boundaries of the California air basins have been changed to facilitate the planning process. CARB generally initiates these changes, and they are not always reflected in the U.S. EPA's area designations. For purposes of consistency, the maps in this attachment reflect area designation boundaries and nomenclature as promulgated by the U.S. EPA. In some cases, these may not be the same as those adopted by CARB. For example, the national area designations reflect the former Southeast Desert Air Basin. In accordance with Health and Safety Code section 39606.1, CARB redefined this area in 1996 to be the Mojave Desert Air Basin and Salton Sea Air Basin. The definitions and boundaries for all areas designated for the national standards can be found in Title 40, Code of Federal Regulations (CFR), Chapter I, Subchapter C, Part 81.305. They are available on the web at:

https://ecfr.io/Title-40/se40.20.81_1305

* Definitions and references for all areas can be found in 40 CFR, Chapter I, Part 81.305.

NOTE: This map and table reflect the 2015 8-hour ozone standard of 0.070 ppm.

(1) South Central Coast Air Basin Channel Islands:

Santa Barbara County includes Santa Cruz, San Miguel, Santa Rosa, and Santa Barbara Islands.

Ventura County includes Anacapa and San Nicolas Islands.

South Coast Air Basin:

Los Angeles County includes San Clemente and Santa Catalina Islands.

(2) For this purpose, the Sacramento Metro Area comprises all of Sacramento and Yolo Counties, the Sacramento Valley Air Basin portion of Solano County, the southern portion of Sutter County, and the Sacramento Valley and Mountain Counties Air Basins portions of Placer and El Dorado counties.

(1) Air quality in Sacramento County meets the national PM10 standards. The request for redesignation to attainment was approved by U.S. EPA in September 2013.

(2) U.S. EPA designation puts the Sacramento Valley Air Basin portion of Placer County in the Mountain Counties Air Basin.

(3) Air quality in Coachella Valley meets the national PM10 standards. A request for redesignation to attainment has been submitted to U.S. EPA.

* Definitions and references for all areas can be found in 40 CFR, Chapter I, Part 81.305. This map reflects the 2006 24-hour PM2.5 standard as well as the 1997 and 2012 PM2.5 annual standards.

(1) For this purpose, Sacramento Metro Area comprises all of Sacramento and portions of El Dorado, Placer, Solano, and Yolo Counties. Air quality in this area meets the national PM2.5 standards. A Determination of Attainment for the 2006 24-hour PM2.5 standard was made by U.S. EPA in June 2017.

(2) Air quality in this area meets the national PM2.5 standards. A Determination of Attainment for the 2006 24-hour PM2.5 standard was made by U.S. EPA in June 2017.

(3) Those lands of the Santa Rosa Band of Cahulla Mission Indians in Riverside County are designated Unclassifiable/Attainment.

(4) That portion of Imperial County encompassing the urban and surrounding areas of Brawley, Calexico, El Centro, Heber, Holtville, Imperial, Seeley, and Westmorland. Air quality in this area meets the national PM2.5 standards. A Determination of Attainment for the 2006 24-hour PM2.5 standard was made by U.S. EPA in June 2017.

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Construction - Unmitigated) - Los Angeles-South Coast County, Winter

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project area is approximately 6.3 acres

Construction Phase - Construction anticipated to be completed in 2022

Off-road Equipment - Hours are based on an 8-hour workday

Off-road Equipment - Crawler Tractors used in lieu of Tractors/Loaders/Backhoes

Off-road Equipment -

Off-road Equipment - Crawler Tractors used in lieu of Tractors/Loaders/Backhoes

Off-road Equipment -

Off-road Equipment - Crawler Tractors used in lieu of Tractors/Loaders/Backhoes

Trips and VMT - Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for Demolition, Site Preparation, Grading, and Building Construction

Demolition -

Grading - This analysis conservatively assumes that up to 5 acres will be disturbed per day

Architectural Coating - Rule 1113

Vehicle Trips - Construction run only

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - Construction run only

Water And Wastewater - Construction run only

Solid Waste - Construction run only

Construction Off-road Equipment Mitigation - Rule 403

Fleet Mix -

Area Coating -

Consumer Products - Construction only

San Francisco Avenue (Proposed Project Operations)

Los Angeles-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	61.80	1000sqft	1.42	61,798.00	0
User Defined Industrial	125.60	User Defined Unit	0.00	0.00	0
Other Asphalt Surfaces	51.84	1000sqft	1.19	51,836.00	0
Parking Lot	376.00	Space	1.46	58,572.00	0
City Park	0.81	Acre	0.81	35,405.00	0
Unrefrigerated Warehouse-No Rail	61.80	1000sqft	1.42	61,797.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	564.66	CH4 Intensity (lb/MW hr)	0.023	N2O Intensity (lb/MW hr)	0.005

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Proposed Project Operations) - Los Angeles-South Coast County, Summer

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project site is approximately 6.3 acres

Construction Phase - Operations run only

Off-road Equipment - Operations run only

Trips and VMT - Operations run only

Vehicle Trips - Trip characteristics based on information provided in the Traffic Assessment

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - The Project will design building shells and building components to meet 2019 Title 24 Standards which expects 30% less energy for nonresidential uses

Operational Off-Road Equipment - Based on SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results (2014)

Fleet Mix - Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY). Truck Mix based on information in the Traffic Analysis

Area Coating -

Water And Wastewater -

Solid Waste -

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Proposed Project Operations) - Los Angeles-South Coast County, Winter

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project site is approximately 6.3 acres

Construction Phase - Operations run only

Off-road Equipment - Operations run only

Trips and VMT - Operations run only

Vehicle Trips - Trip characteristics based on information provided in the Traffic Assessment

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - The Project will design building shells and building components to meet 2019 Title 24 Standards which expects 30% less energy for nonresidential uses

Operational Off-Road Equipment - Based on SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results (2014)

Fleet Mix - Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY). Truck Mix based on information in the Traffic Analysis

Area Coating -

Water And Wastewater -

Solid Waste -

San Francisco Avenue (Currently Approved Operations) - Los Angeles-South Coast County, Summer

San Francisco Avenue (Currently Approved Operations)
Los Angeles-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	137.43	1000sqft	3.16	137,432.00	0
User Defined Industrial	137.43	User Defined Unit	0.00	0.00	0
Other Asphalt Surfaces	3.14	Acre	3.14	136,778.40	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	564.66	CH4 Intensity (lb/MWhr)	0.023	N2O Intensity (lb/MWhr)	0.005

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Currently Approved Operations) - Los Angeles-South Coast County, Summer

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project area is approximately 6.3 acres

Construction Phase - Operations run only

Off-road Equipment - Operations run only

Trips and VMT - Operations run only

Vehicle Trips - Trip characteristics based on information provided in the Traffic Assessment

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - The Project will design building shells and building components to meet 2019 Title 24 Standards which expects 30% less energy for nonresidential uses

Operational Off-Road Equipment - Based on SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results (2014)

Fleet Mix - Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY). Truck Mix based on information in the Traffic Analysis

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	564.66	CH4 Intensity (lb/MWhr)	0.023	N2O Intensity (lb/MWhr)	0.005

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Currently Approved Operations) - Los Angeles-South Coast County, Winter

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project area is approximately 6.3 acres

Construction Phase - Operations run only

Off-road Equipment - Operations run only

Trips and VMT - Operations run only

Vehicle Trips - Trip characteristics based on information provided in the Traffic Assessment

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - The Project will design building shells and building components to meet 2019 Title 24 Standards which expects 30% less energy for nonresidential uses

Operational Off-Road Equipment - Based on SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results (2014)

Fleet Mix - Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY). Truck Mix based on information in the Traffic Analysis

1 Source: California Air Resources Board. EMFAC2017 Web Database. <https://www.arb.ca.gov/emfac/2017/>; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Los Angeles (SC) region.

3 Because EMFAC2017 provides vehicle trips data for MHD and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_x STREX emission rates are utilized.

SCAQMD AMICUS BRIEF

This page intentionally left blank

S219783

IN THE SUPREME COURT OF CALIFORNIA

SIERRA CLUB, REVIVE THE SAN JOAQUIN, and
LEAGUE OF WOMEN VOTERS OF FRESNO,

Plaintiffs and Appellants,

v.

COUNTY OF FRESNO,

Defendant and Respondent,

and,

FRIANT RANCH, L.P.,

Real Party in Interest and Respondent.

SUPREME COURT
FILED

APR 13 2015

Frank A. McGuire Clerk
Deputy

After a Published Decision by the Court of Appeal, filed May 27, 2014
Fifth Appellate District Case No. F066798

Appeal from the Superior Court of California, County of Fresno
Case No. 11CECG00726
Honorable Rosendo A. Pena, Jr.

**APPLICATION OF THE SOUTH COAST AIR QUALITY
MANAGEMENT DISTRICT FOR LEAVE TO FILE
BRIEF OF *AMICUS CURIAE* IN SUPPORT OF NEITHER PARTY
AND [PROPOSED] BRIEF OF *AMICUS CURIAE***

Kurt R. Wiese, General Counsel (SBN 127251)
*Barbara Baird, Chief Deputy Counsel (SBN 81507)
SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT
21865 Copley Drive, Diamond Bar, CA 91765
Telephone: 909-396-2302; Facsimile: 909-396-2961

Counsel for [Proposed] Amicus Curiae,
SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

RECEIVED

APR - 8 2015

CLERK SUPREME COURT

TABLE OF CONTENTS

APPLICATION FOR LEAVE TO FILE <i>amicus curiae</i> brief.....	App-1
HOW THIS BRIEF WILL ASSIST THE COURT	App-1
STATEMENT OF INTEREST OF <i>AMICUS CURIAE</i>	App-3
CERTIFICATION REGARDING AUTHORSHIP & FUNDING	App-4
BRIEF OF AMICUS CURIAE.....	1
SUMMARY OF ARGUMENT	1
ARGUMENT	2
I. RELEVANT FACTUAL AND LEGAL FRAMEWORK.	2
A. Air Quality Regulatory Background	2
B. The SCAQMD's Role Under CEQA.....	6
II. THIS COURT SHOULD NOT SET A HARD-AND-FAST RULE CONCERNING THE EXTENT TO WHICH AN EIR MUST CORRELATE A PROJECT'S EMISSION OF POLLUTANTS WITH RESULTING HEALTH IMPACTS.....	8
III. THE QUESTION OF WHETHER AN EIR CONTAINS SUFFICIENT ANALYSIS TO MEET CEQA'S REQUIREMENTS IS A MIXED QUESTION OF FACT AND LAW GOVERNED BY TWO DIFFERENT STANDARDS OF REVIEW.....	16
A. Standard of Review for Feasibility Determination and Sufficiency as an Informative Document.....	16
B. Friant Ranch's Rationale for Rejecting the Independent Judgment Standard of Review is Unsupported by Case Law.....	23
IV. COURTS MUST SCRUPULOUSLY ENFORCE THE REQUIREMENTS THAT LEAD AGENCIES CONSULT WITH AND OBTAIN COMMENTS FROM AIR DISTRICTS.....	26
CONCLUSION	29

**TO THE HONORABLE CHIEF JUSTICE AND JUSTICES OF THE
SUPREME COURT:**

APPLICATION FOR LEAVE TO FILE *AMICUS CURIAE* BRIEF

Pursuant to Rule 8.520(f) of the California Rules of Court, the South Coast Air Quality Management District (SCAQMD) respectfully requests leave to file the attached *amicus curiae* brief. Because SCAQMD's position differs from that of either party, we request leave to submit this amicus brief in support of neither party.

HOW THIS BRIEF WILL ASSIST THE COURT

SCAQMD's proposed amicus brief takes a position on two of the issues in this case. In both instances, its position differs from that of either party. The issues are:

- 1) Does the California Environmental Quality Act (CEQA) require an environmental impact report (EIR) to correlate a project's air pollution emissions with specific levels of health impacts?
- 2) What is the proper standard of review for determining whether an EIR provides sufficient information on the health impacts caused by a project's emission of air pollutants?

This brief will assist the Court by discussing the practical realities of correlating identified air quality impacts with specific health outcomes. In short, CEQA requires agencies to provide detailed information about a project's air quality impacts that is sufficient for the public and decisionmakers to adequately evaluate the project and meaningfully understand its impacts. However, the level of analysis is governed by a rule of reason; CEQA only requires agencies to conduct analysis if it is reasonably feasible to do so.

With regard to health-related air quality impacts, an analysis that correlates a project's air pollution emissions with specific levels of health impacts will be feasible in some cases but not others. Whether it is feasible depends on a variety of factors, including the nature of the project and the nature of the analysis under consideration. The feasibility of analysis may also change over time as air districts and others develop new tools for measuring projects' air quality related health impacts. Because SCAQMD has among the most sophisticated air quality modeling and health impact evaluation capability of any of the air districts in the State, it is uniquely situated to express an opinion on the extent to which the Court should hold that CEQA requires lead agencies to correlate air quality impacts with specific health outcomes.

SCAQMD can also offer a unique perspective on the question of the appropriate standard of review. SCAQMD submits that the proper standard of review for determining whether an EIR is sufficient as an informational document is more nuanced than argued by either party. In our view, this is a mixed question of fact and law. It includes determining whether additional analysis is feasible, which is primarily a factual question that should be reviewed under the substantial evidence standard. However, it also involves determining whether the omission of a particular analysis renders an EIR insufficient to serve CEQA's purpose as a meaningful, informational document. If a lead agency has not determined that a requested analysis is infeasible, it is the court's role to determine whether the EIR nevertheless meets CEQA's purposes, and courts should not defer to the lead agency's conclusions regarding the legal sufficiency of an EIR's analysis. The ultimate question of whether an EIR's analysis is "sufficient" to serve CEQA's informational purposes is predominately a question of law that courts should review de novo.

This brief will explain the rationale for these arguments and may assist the Court in reaching a conclusion that accords proper respect to a lead agency's factual conclusions while maintaining judicial authority over the ultimate question of what level of analysis CEQA requires.

STATEMENT OF INTEREST OF *AMICUS CURIAE*

The SCAQMD is the regional agency primarily responsible for air pollution control in the South Coast Air Basin, which consists of all of Orange County and the non-desert portions of the Los Angeles, Riverside, and San Bernardino Counties. (Health & Saf. Code § 40410; Cal. Code Regs., tit. 17, § 60104.) The SCAQMD participates in the CEQA process in several ways. Sometimes it acts as a lead agency that prepares CEQA documents for projects. Other times it acts as a responsible agency when it has permit authority over some part of a project that is undergoing CEQA review by a different lead agency. Finally, SCAQMD also acts as a commenting agency for CEQA documents that it receives because it is a public agency with jurisdiction by law over natural resources affected by the project.

In all of these capacities, SCAQMD will be affected by the decision in this case. SCAQMD sometimes submits comments requesting that a lead agency perform an additional type of air quality or health impacts analysis. On the other hand, SCAQMD sometimes determines that a particular type of health impact analysis is not feasible or would not produce reliable and informative results. Thus, SCAQMD will be affected by the Court's resolution of the extent to which CEQA requires EIRs to correlate emissions and health impacts, and its resolution of the proper standard of review.

CERTIFICATION REGARDING AUTHORSHIP AND FUNDING

No party or counsel in the pending case authored the proposed amicus curiae brief in whole or in part, or made any monetary contribution intended to fund the preparation or submission of the brief. No person or entity other than the proposed *Amicus Curiae* made any monetary contribution intended to fund the preparation or submission of the brief.

Respectfully submitted,

DATED: April 3, 2015

SOUTH COAST AIR QUALITY
MANAGEMENT DISTRICT
KURT R. WIESE, GENERAL COUNSEL
BARBARA BAIRD, CHIEF DEPUTY COUNSEL

By: 
Barbara Baird

Attorneys for [proposed] Amicus Curiae
SOUTH COAST AIR QUALITY
MANAGEMENT DISTRICT

BRIEF OF AMICUS CURIAE

SUMMARY OF ARGUMENT

The South Coast Air Quality Management District (SCAQMD) submits that this Court should not try to establish a hard-and-fast rule concerning whether lead agencies are required to correlate emissions of air pollutants with specific health consequences in their environmental impact reports (EIR). The level of detail required in EIRs is governed by a few, core CEQA (California Environmental Quality Act) principles. As this Court has stated, “[a]n EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.” (*Laurel Heights Improvement Assn. v. Regents of the Univ of Cal.* (1988) 47 Cal.3d 376, 405 [*“Laurel Heights I”*]) Accordingly, “an agency must use its best efforts to find out and disclose all that it reasonably can.” (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 428 (quoting CEQA Guidelines § 15144)¹). However, “[a]nalysis of environmental effects need not be exhaustive, but will be judged in light of what is reasonably feasible.” (*Association of Irrigated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1390; CEQA Guidelines §§ 15151, 15204(a).)

With regard to analysis of air quality related health impacts, EIRs must generally quantify a project’s pollutant emissions, but in some cases it is not feasible to correlate these emissions to specific, quantifiable health impacts (e.g., premature mortality; hospital admissions). In such cases, a general description of the adverse health impacts resulting from the pollutants at issue may be sufficient. In other cases, due to the magnitude

¹ The CEQA Guidelines are found at Cal. Code Regs., tit. 14 §§ 15000, *et seq.*

or nature of the pollution emissions, as well as the specificity of the project involved, it may be feasible to quantify health impacts. Or there may be a less exacting, but still meaningful analysis of health impacts that can feasibly be performed. In these instances, agencies should disclose those impacts.

SCAQMD also submits that whether or not an EIR complies with CEQA's informational mandates by providing sufficient, feasible analysis is a mixed question of fact and law. Pertinent here, the question of whether an EIR's discussion of health impacts from air pollution is sufficient to allow the public to understand and consider meaningfully the issues involves two inquiries: (1) Is it feasible to provide the information or analysis that a commenter is requesting or a petitioner is arguing should be required?; and (2) Even if it is feasible, is the agency relying on other policy or legal considerations to justify not preparing the requested analysis? The first question of whether an analysis is feasible is primarily a question of fact that should be judged by the substantial evidence standard. The second inquiry involves evaluating CEQA's information disclosure purposes against the asserted reasons to not perform the requested analysis. For example, an agency might believe that its EIR meets CEQA's informational disclosure standards even without a particular analysis, and therefore choose not to conduct that analysis. SCAQMD submits that this is more of a legal question, which should be reviewed de novo as a question of law.

ARGUMENT

I. RELEVANT FACTUAL AND LEGAL FRAMEWORK.

A. Air Quality Regulatory Background

The South Coast Air Quality Management District (SCAQMD) is one of the local and regional air pollution control districts and air quality

management districts in California. The SCAQMD is the regional air pollution agency for the South Coast Air Basin, which consists of all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. (Health & Saf. Code § 40410, 17 Cal. Code Reg. § 60104.) The SCAQMD also includes the Coachella Valley in Riverside County (Palm Springs area to the Salton Sea). (SCAQMD, *Final 2012 AQMP* (Feb. 2013), <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan>; then follow “chapter 7” hyperlink; pp 7-1, 7-3 (last visited Apr. 1, 2015).) The SCAQMD's jurisdiction includes over 16 million residents and has the worst or nearly the worst air pollution levels in the country for ozone and fine particulate matter. (SCAQMD, *Final 2012 AQMP* (Feb. 2013), <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan>; then follow “Executive Summary” hyperlink p. ES-1 (last visited Apr. 1, 2015).)

Under California law, the local and regional districts are primarily responsible for controlling air pollution from all sources except motor vehicles. (Health & Saf. Code § 40000.) The California Air Resources Board (CARB), part of the California Environmental Protection Agency, is primarily responsible for controlling pollution from motor vehicles. (*Id.*) The air districts must adopt rules to achieve and maintain the state and federal ambient air quality standards within their jurisdictions. (Health & Saf. Code § 40001.)

The federal Clean Air Act (CAA) requires the United States Environmental Protection Agency (EPA) to identify pollutants that are widely distributed and pose a threat to human health, developing a so-called “criteria” document. (42 U.S.C. § 7408; CAA § 108.) These pollutants are frequently called “criteria pollutants.” EPA must then establish “national ambient air quality standards” at levels “requisite to protect public health”,

allowing “an adequate margin of safety.” (42 U.S.C. § 7409; CAA § 109.) EPA has set standards for six identified pollutants: ozone, nitrogen dioxide, sulfur dioxide, carbon monoxide, particulate matter (PM), and lead. (U.S. EPA, National Ambient Air Quality Standards (NAAQS), <http://www.epa.gov/air/criteria.html> (last updated Oct. 21, 2014).)²

Under the Clean Air Act, EPA sets emission standards for motor vehicles and “nonroad engines” (mobile farm and construction equipment, marine vessels, locomotives, aircraft, etc.). (42 U.S.C. §§ 7521, 7547; CAA §§ 202, 213.) California is the only state allowed to establish emission standards for motor vehicles and most nonroad sources; however, it may only do so with EPA's approval. (42 U.S.C. §§ 7543(b), 7543(e); CAA §§ 209(b), 209(c).) Sources such as manufacturing facilities, power plants and refineries that are not mobile are often referred to as “stationary sources.” The Clean Air Act charges state and local agencies with the primary responsibility to attain the national ambient air quality standards. (42 U.S.C. § 7401(a)(3); CAA § 101(a)(3).) Each state must adopt and implement a plan including enforceable measures to achieve and maintain the national ambient air quality standards. (42 U.S.C. § 7410; CAA § 110.) The SCAQMD and CARB jointly prepare portion of the plan for the South Coast Air Basin and submit it for approval by EPA. (Health & Saf. Code §§ 40460, et seq.)

The Clean Air Act also requires state and local agencies to adopt a permit program requiring, among other things, that new or modified “major” stationary sources use technology to achieve the “lowest achievable emission rate,” and to control minor stationary sources as

² Particulate matter (PM) is further divided into two categories: fine particulate or PM_{2.5} (particles with a diameter of less than or equal to 2.5 microns) and coarse particulate (PM₁₀) (particles with a diameter of 10 microns or less). (U.S. EPA, Particulate Matter (PM), <http://www.epa.gov/airquality/particulatepollution/> (last visited Apr. 1, 2015).)

needed to help attain the standards. (42 U.S.C. §§ 7502(c)(5), 7503(a)(2), 7410(a)(2)(C); CAA §§ 172(c)(5), 173(a)(2), 110(a)(2)(C).) The air districts implement these permit programs in California. (Health & Saf. Code §§ 42300, et seq.)

The Clean Air Act also sets out a regulatory structure for over 100 so-called “hazardous air pollutants” calling for EPA to establish “maximum achievable control technology” (MACT) for sources of these pollutants. (42 U.S.C. § 7412(d)(2); CAA § 112(d)(2).) California refers to these pollutants as “toxic air contaminants” (TACs) which are subject to two state-required programs. The first program requires “air toxics control measures” for specific categories of sources. (Health & Saf. Code § 39666.) The other program requires larger stationary sources and sources identified by air districts to prepare “health risk assessments” for impacts of toxic air contaminants. (Health & Saf. Code §§ 44320(b), 44322, 44360.) If the health risk exceeds levels identified by the district as “significant,” the facility must implement a “risk reduction plan” to bring its risk levels below “significant” levels. Air districts may adopt additional more stringent requirements than those required by state law, including requirements for toxic air contaminants. (Health & Saf. Code § 41508; *Western Oil & Gas Assn. v. Monterey Bay Unified APCD* (1989) 49 Cal.3d 408, 414.) For example, SCAQMD has adopted a rule requiring new or modified sources to keep their risks below specified levels and use best available control technology (BACT) for toxics. (SCAQMD, *Rule 1401-New Source Review of Toxic Air Contaminants*, <http://www.aqmd.gov/home/regulations/rules/scaqmd-rule-book/regulation-xiv>; then follow “Rule 1401” hyperlink (last visited Apr. 1, 2015).)

B. The SCAQMD's Role Under CEQA

The California Environmental Quality Act (CEQA) requires public agencies to perform an environmental review and appropriate analysis for projects that they implement or approve. (Pub. Resources Code § 21080(a).) The agency with primary approval authority for a particular project is generally the “lead agency” that prepares the appropriate CEQA document. (CEQA Guidelines §§ 15050, 15051.) Other agencies having a subsequent approval authority over all or part of a project are called “responsible” agencies that must determine whether the CEQA document is adequate for their use. (CEQA Guidelines §§ 15096(c), 15381.) Lead agencies must also consult with and circulate their environmental impact reports to “trustee agencies” and agencies “with jurisdiction by law” including “authority over resources which may be affected by the project.” (Pub. Resources Code §§ 21104(a), 21153; CEQA Guidelines §§ 15086(a)(3), 15073(c).) The SCAQMD has a role in all these aspects of CEQA.

Fulfilling its responsibilities to implement its air quality plan and adopt rules to attain the national ambient air quality standards, SCAQMD adopts a dozen or more rules each year to require pollution reductions from a wide variety of sources. The SCAQMD staff evaluates each rule for any adverse environmental impact and prepares the appropriate CEQA document. Although most rules reduce air emissions, they may have secondary environmental impacts such as use of water or energy or disposal of waste—e.g., spent catalyst from control equipment.³

³ The SCAQMD's CEQA program for its rules is a “Certified Regulatory Program” under which it prepares a “functionally equivalent” document in lieu of a negative declaration or EIR. (Pub. Resources Code § 21080.5, CEQA Guidelines § 15251(l).)

The SCAQMD also approves a large number of permits every year to construct new, modified, or replacement facilities that emit regulated air pollutants. The majority of these air pollutant sources have already been included in an earlier CEQA evaluation for a larger project, are currently being evaluated by a local government as lead agency, or qualify for an exemption. However, the SCAQMD sometimes acts as lead agency for major projects where the local government does not have a discretionary approval. In such cases, SCAQMD prepares and certifies a negative declaration or environmental impact report (EIR) as appropriate.⁴ SCAQMD evaluates perhaps a dozen such permit projects under CEQA each year. SCAQMD is often also a “responsible agency” for many projects since it must issue a permit for part of the projects (e.g., a boiler used to provide heat in a commercial building). For permit projects evaluated by another lead agency under CEQA, SCAQMD has the right to determine that the CEQA document is inadequate for its purposes as a responsible agency, but it may not do so because its permit program already requires all permitted sources to use the best available air pollution control technology. (SCAQMD, *Rule 1303(a)(1) – Requirements*, <http://www.aqmd.gov/home/regulations/rules/scaqmd-rule-book/regulation-xiii>; then follow “Rule 1303” hyperlink (last visited Apr. 1, 2015).)

Finally, SCAQMD receives as many as 60 or more CEQA documents each month (around 500 per year) in its role as commenting agency or an agency with “jurisdiction by law” over air quality—a natural resource affected by the project. (Pub. Resources Code §§ 21104(a), 21153; CEQA Guidelines § 15366(a)(3).) The SCAQMD staff provides comments on as many as 25 or 30 such documents each month.

⁴ The SCAQMD's permit projects are not included in its Certified Regulatory Program, and are evaluated under the traditional local government CEQA analysis. (Pub. Resources Code §§ 21150-21154.)

(SCAQMD Governing Board Agenda, Apr. 3, 2015, Agenda Item 16, Attachment A, <http://www.aqmd.gov/home/library/meeting-agendas-minutes/agenda?title=governing-board-meeting-agenda-april-3-2015>; then follow “16. Lead Agency Projects and Environmental Documents Received by SCAQMD” hyperlink (last visited Apr. 1, 2015).) Of course, SCAQMD focuses its commenting efforts on the more significant projects.

Typically, SCAQMD comments on the adequacy of air quality analysis, appropriateness of assumptions and methodology, and completeness of the recommended air quality mitigation measures. Staff may comment on the need to prepare a health risk assessment detailing the projected cancer and noncancer risks from toxic air contaminants resulting from the project, particularly the impacts of diesel particulate matter, which CARB has identified as a toxic air contaminant based on its carcinogenic effects. (California Air Resources Board, Resolution 98-35, Aug. 27, 1998, <http://www.arb.ca.gov/regact/diesltac/diesltac.htm>; then follow Resolution 98-35 hyperlink (last visited Apr. 1, 2015).) Because SCAQMD already requires new or modified stationary sources of toxic air contaminants to use the best available control technology for toxics and to keep their risks below specified levels, (SCAQMD Rule 1401, *supra*, note 15), the greatest opportunity to further mitigate toxic impacts through the CEQA process is by reducing emissions—particularly diesel emissions—from vehicles.

II. THIS COURT SHOULD NOT SET A HARD-AND-FAST RULE CONCERNING THE EXTENT TO WHICH AN EIR MUST CORRELATE A PROJECT’S EMISSION OF POLLUTANTS WITH RESULTING HEALTH IMPACTS.

Numerous cases hold that courts do not review the correctness of an EIR’s conclusions but rather its sufficiency as an informative document. (*Laurel Heights 1*, *supra*, 47 Cal.3d at p. 392; *Citizens of Goleta Valley v.*

Bd. of Supervisors (1990) 52 Cal.3d 553, 569; *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1197.)

As stated by the Court of Appeal in this case, where an EIR has addressed a topic, but the petitioner claims that the information provided about that topic is insufficient, courts must “draw[] a line that divides *sufficient* discussions from those that are *insufficient*.” (*Sierra Club v. County of Fresno* (2014) 226 Cal.App.4th 704 (superseded by grant of review) 172 Cal.Rptr.3d 271, 290.) The Court of Appeal readily admitted that “[t]he terms themselves – sufficient and insufficient – provide little, if any, guidance as to where the line should be drawn. They are simply labels applied once the court has completed its analysis.” (*Id.*)

The CEQA Guidelines, however, provide guidance regarding what constitutes a sufficient discussion of impacts. Section 15151 states that “the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible.” Case law reflects this: “Analysis of environmental effects need not be exhaustive, but will be judged in light of what was reasonably feasible.” (*Association of Irrigated Residents v. County of Madera, supra*, 107 Cal.App.4th at p. 1390; see also CEQA Guidelines § 15204(a).)

Applying this test, this Court cannot realistically establish a hard-and-fast rule that an analysis correlating air pollution impacts of a project to quantified resulting health impacts is always required, or indeed that it is never required. Simply put, in some cases such an analysis will be “feasible”; in some cases it will not.

For example, air pollution control districts often require a proposed new source of toxic air contaminants to prepare a “health risk assessment” before issuing a permit to construct. District rules often limit the allowable cancer risk the new source may cause to the “maximally exposed individual” (worker and residence exposures). (See, e.g., SCAQMD Rule 1401(c)(8); 1401(d)(1), *supra* note 15.) In order to perform this analysis, it

is necessary to have data regarding the sources and types of air toxic contaminants, location of emission points, velocity of emissions, the meteorology and topography of the area, and the location of receptors (worker and residence). (SCAQMD, *Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots" Information and Assessment Act (AB2588)*, pp. 11-16; (last visited Apr. 1, 2015) [http://www.aqmd.gov/home/library/documents-support-material](http://www.aqmd.gov/home/library/documents-support-material;); "Guidelines" hyperlink; AB2588; then follow AB2588 Risk Assessment Guidelines hyperlink.)

Thus, it is feasible to determine the health risk posed by a new gas station locating at an intersection in a mixed use area, where receptor locations are known. On the other hand, it may not be feasible to perform a health risk assessment for airborne toxics that will be emitted by a generic industrial building that was built on "speculation" (i.e., without knowing the future tenant(s)). Even where a health risk assessment can be prepared, however, the resulting maximum health risk value is only a calculation of risk—it does not necessarily mean anyone will contract cancer as a result of the project.

In order to find the "cancer burden" or expected additional cases of cancer resulting from the project, it is also necessary to know the numbers and location of individuals living within the "zone of impact" of the project: i.e., those living in areas where the projected cancer risk from the project exceeds one in a million. (SCAQMD, Health Risk Assessment Summary form, <http://www.aqmd.gov/home/forms>; filter by "AB2588" category; then "Health Risk Assessment" hyperlink (last visited Apr. 1, 2015).) The affected population is divided into bands of those exposed to at least 1 in a million risk, those exposed to at least 10 in a million risk, etc. up to those exposed at the highest levels. (*Id.*) This data allows agencies to calculate an approximate number of additional cancer cases expected from

the project. However, it is not possible to predict which particular individuals will be affected.

For the so-called criteria pollutants⁵, such as ozone, it may be more difficult to quantify health impacts. Ozone is formed in the atmosphere from the chemical reaction of the nitrogen oxides (NO_x) and volatile organic compounds (VOC) in the presence of sunlight. (U.S. EPA, Ground Level Ozone, <http://www.epa.gov/airquality/ozonepollution/> (last updated Mar. 25, 2015).) It takes time and the influence of meteorological conditions for these reactions to occur, so ozone may be formed at a distance downwind from the sources. (U.S. EPA, *Guideline on Ozone Monitoring Site Selection* (Aug. 1998) EPA-454/R-98-002 § 5.1.2, <http://www.epa.gov/ttnamti1/archive/cpreldoc.html> (last visited Apr. 1, 2015).) NO_x and VOC are known as “precursors” of ozone.

Scientifically, health effects from ozone are correlated with increases in the ambient level of ozone in the air a person breathes. (U.S. EPA, *Health Effects of Ozone in the General Population*, Figure 9, <http://www.epa.gov/apti/ozonehealth/population.html#levels> (last visited Apr. 1, 2015).) However, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region. For example, the SCAQMD's 2012 AQMP showed that reducing NO_x by 432 tons per day (157,680 tons/year) and reducing VOC by 187 tons per day (68,255 tons/year) would reduce ozone levels at the SCAQMD's monitor site with the highest levels by only 9 parts per billion. (South Coast Air Quality Management District, *Final 2012 AQMP* (February 2013), <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan>; then follow “Appendix V: Modeling & Attainment Demonstrations” hyperlink,

⁵ See discussion of types of pollutants, *supra*, Part I.A.

pp. v-4-2, v-7-4, v-7-24.) SCAQMD staff does not currently know of a way to accurately quantify ozone-related health impacts caused by NO_x or VOC emissions from relatively small projects.

On the other hand, this type of analysis may be feasible for projects on a regional scale with very high emissions of NO_x and VOCs, where impacts are regional. For example, in 2011 the SCAQMD performed a health impact analysis in its CEQA document for proposed Rule 1315, which authorized various newly-permitted sources to use offsets from the districts “internal bank” of emission reductions. This CEQA analysis accounted for essentially *all* the increases in emissions due to new or modified sources in the District between 2010 and 2030.⁶ The SCAQMD was able to correlate this very large emissions increase (e.g., 6,620 pounds per day NO_x (1,208 tons per year), 89,180 pounds per day VOC (16,275 tons per year)) to expected health outcomes from ozone and particulate matter (e.g., 20 premature deaths per year and 89,947 school absences in the year 2030 due to ozone).⁷ (SCAQMD Governing Board Agenda, February 4, 2011, Agenda Item 26, *Assessment for: Re-adoption of Proposed Rule 1315 – Federal New Source Review Tracking System* (see hyperlink in fn 6) at p. 4.1-35, Table 4.1-29.)

⁶ (SCAQMD Governing Board Agenda, February 4, 2011, Agenda Item 26, Attachment G, *Assessment for: Re-adoption of Proposed Rule 1315 – Federal New Source Review Tracking System, Vol. 1, p.4.0-6*, <http://www.aqmd.gov/home/library/meeting-agendas-minutes/agenda?title=governing-board-meeting-agenda-february-4-2011>; the follow “26. Adopt Proposed Rule 1315 – Federal New Source Review Tracking System” (last visited April 1, 2015).)

⁷ The SCAQMD was able to establish the location of future NO_x and VOC emissions by assuming that new projects would be built in the same locations and proportions as existing stationary sources. This CEQA document was upheld by the Los Angeles County Superior Court in *Natural Res. Def. Council v SCAQMD*, Los Angeles Superior Court No. BS110792).

However, a project emitting only 10 tons per year of NO_x or VOC is small enough that its regional impact on ambient ozone levels may not be detected in the regional air quality models that are currently used to determine ozone levels. Thus, in this case it would not be feasible to directly correlate project emissions of VOC or NO_x with specific health impacts from ozone. This is in part because ozone formation is not linearly related to emissions. Ozone impacts vary depending on the location of the emissions, the location of other precursor emissions, meteorology and seasonal impacts, and because ozone is formed some time later and downwind from the actual emission. (EPA Guideline on Ozone Monitoring Site Selection (Aug. 1998) EPA-454/R-98-002, § 5.1.2; <https://www.epa.gov/ttnamti1/archive/cpreldoc.html>; then search “Guideline on Ozone Monitoring Site Selection” click on pdf) (last viewed Apr. 1, 2015).)

SCAQMD has set its CEQA “significance” threshold for NO_x and VOC at 10 tons per year (expressed as 55 lb/day). (SCAQMD, *Air Quality Analysis Handbook*, <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook>; then follow “SCAQMD Air Quality Significance Thresholds” hyperlink (last visited Apr. 1, 2015).) This is because the federal Clean Air Act defines a “major” stationary source for “extreme” ozone nonattainment areas such as SCAQMD as one emitting 10 tons/year. (42 U.S.C. §§ 7511a(e), 7511a(f); CAA §§ 182(e), 182(f).) Under the Clean Air Act, such sources are subject to enhanced control requirements (42 U.S.C. §§ 7502(c)(5), 7503; CAA §§ 172(c)(5), 173), so SCAQMD decided this was an appropriate threshold for making a CEQA “significance” finding and requiring feasible mitigation. Essentially, SCAQMD takes the position that a source that emits 10 tons/year of NO_x or VOC would contribute cumulatively to ozone formation. Therefore, lead agencies that use SCAQMD’s thresholds of significance may determine

that many projects have “significant” air quality impacts and must apply all feasible mitigation measures, yet will not be able to precisely correlate the project to quantifiable health impacts, unless the emissions are sufficiently high to use a regional modeling program.

In the case of particulate matter (PM_{2.5})⁸, another “criteria” pollutant, SCAQMD staff is aware of two possible methods of analysis. SCAQMD used regional modeling to predict expected health impacts from its proposed Rule 1315, as mentioned above. Also, the California Air Resources Board (CARB) has developed a methodology that can predict expected mortality (premature deaths) from large amounts of PM_{2.5}. (California Air Resources Board, *Health Impacts Analysis: PM Premature Death Relationship*, http://www.arb.ca.gov/research/health/pm-mort/pm-mort_arch.htm (last reviewed Jan. 19, 2012).) SCAQMD used the CARB methodology to predict impacts from three very large power plants (e.g., 731-1837 lbs/day). (Final Environmental Assessment for Rule 1315, *supra*, pp 4.0-12, 4.1-13, 4.1-37 (e.g., 125 premature deaths in the entire SCAQMD in 2030), 4.1-39 (0.05 to 1.77 annual premature deaths from power plants.) Again, this project involved large amounts of additional PM_{2.5} in the District, up to 2.82 tons/day (5,650 lbs/day of PM_{2.5}, or, or 1029 tons/year. (*Id.* at table 4.1-4, p. 4.1-10.)

However, the primary author of the CARB methodology has reported that this PM_{2.5} health impact methodology is not suited for small projects and may yield unreliable results due to various uncertainties.⁹ (SCAQMD, *Final Subsequent Mitigated Negative Declaration for: Warren*

⁸ SCAQMD has not attained the latest annual or 24-hour national ambient air quality standards for “PM_{2.5}” or particulate matter less than 2.5 microns in diameter.

⁹ Among these uncertainties are the representativeness of the population used in the methodology, and the specific source of PM and the corresponding health impacts. (*Id.* at p. 2-24.)

E&P, Inc. WTU Central Facility, New Equipment Project (certified July 19, 2011), <http://www.aqmd.gov/home/library/documents-support-material/lead-agency-permit-projects/permit-project-documents---year-2011>; then follow “Final Subsequent Mitigated Negative Declaration for Warren E&P Inc. WTU Central Facility, New Equipment Project” hyperlink, pp. 2-22, 2-23 (last visited Apr. 1, 2015).) Therefore, when SCAQMD prepared a CEQA document for the expansion of an existing oil production facility, with very small PM_{2.5} increases (3.8 lb/day) and a very small affected population, staff elected not to use the CARB methodology for using estimated PM_{2.5} emissions to derive a projected premature mortality number and explained why it would be inappropriate to do so. (*Id.* at pp 2-22 to 2-24.) SCAQMD staff concluded that use of this methodology for such a small source could result in unreliable findings and would not provide meaningful information. (*Id.* at pp. 2-23, 2-25.) This CEQA document was not challenged in court.

In the above case, while it may have been technically possible to plug the data into the methodology, the results would not have been reliable or meaningful. SCAQMD believes that an agency should not be required to perform analyses that do not produce reliable or meaningful results. This Court has already held that an agency may decline to use even the “normal” “existing conditions” CEQA baseline where to do so would be misleading or without informational value. (*Neighbors for Smart Rail v. Exposition Metro Line* (2013) 57 Cal.4th 439, 448, 457.) The same should be true for a decision that a particular study or analysis would not provide reliable or meaningful results.¹⁰

¹⁰ Whether a particular study would result in “informational value” is a part of deciding whether it is “feasible.” CEQA defines “feasible” as “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and

Therefore, it is not possible to set a hard-and-fast rule on whether a correlation of air quality impacts with specific quantifiable health impacts is required in all cases. Instead, the result turns on whether such an analysis is reasonably feasible in the particular case.¹¹ Moreover, what is reasonably feasible may change over time as scientists and regulatory agencies continually seek to improve their ability to predict health impacts. For example, CARB staff has been directed by its Governing Board to reassess and improve the methodology for estimating premature deaths. (California Air Resources Board, *Health Impacts Analysis: PM Mortality Relationship*, <http://www.arb.ca.gov/research/health/pm-mort/pm-mort.htm> (last reviewed Dec. 29, 2010).) This factor also counsels against setting any hard-and-fast rule in this case.

III. THE QUESTION OF WHETHER AN EIR CONTAINS SUFFICIENT ANALYSIS TO MEET CEQA'S REQUIREMENTS IS A MIXED QUESTION OF FACT AND LAW GOVERNED BY TWO DIFFERENT STANDARDS OF REVIEW.

A. Standard of Review for Feasibility Determination and Sufficiency as an Informative Document

A second issue in this case is whether courts should review an EIR's informational sufficiency under the "substantial evidence" test as argued by Friant Ranch or the "independent judgment" test as argued by Sierra Club.

technological factors." (Pub. Resources Code § 21061.1.) A study cannot be "accomplished in a *successful* manner" if it produces unreliable or misleading results.

¹¹ In this case, the lead agency did not have an opportunity to determine whether the requested analysis was feasible because the comment was non-specific. Therefore, SCAQMD suggests that this Court, after resolving the legal issues in the case, direct the Court of Appeal to remand the case to the lead agency for a determination of whether the requested analysis is feasible. Because Fresno County, the lead agency, did not seek review in this Court, it seems likely that the County has concluded that at least some level of correlation of air pollution with health impacts is feasible.

As this Court has explained, “a reviewing court must adjust its scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts.” (*Vineyard Area Citizens v. City of Rancho Cordova*, *supra*, 40 Cal.4th at 435.) For questions regarding compliance with proper procedure or other legal questions, courts review an agency’s action de novo under the “independent judgment” test. (*Id.*) On the other hand, courts review factual disputes only for substantial evidence, thereby “accord[ing] greater deference to the agency’s substantive factual conclusions.” (*Id.*)

Here, Friant Ranch and Sierra Club agree that the case involves the question of whether an EIR includes sufficient information regarding a project’s impacts. However, they disagree on the proper standard of review for answering this question: Sierra Club contends that courts use the independent judgment standard to determine whether an EIR’s analysis is sufficient to meet CEQA’s informational purposes,¹² while Friant Ranch contends that the substantial evidence standard applies to this question.

///

///

///

///

///

///

///

///

///

¹² Sierra Club acknowledges that courts use the substantial evidence standard when reviewing predicate factual issues, but argues that courts ultimately decide as a matter of law what CEQA requires. (Answering Brief, pp. 14, 23.)

SCAQMD submits that the issue is more nuanced than either party contends. We submit that, whether a CEQA document includes sufficient analysis to satisfy CEQA's informational mandates is a mixed question of fact and law,¹³ containing two levels of inquiry that should be judged by different standards.¹⁴

The state CEQA Guidelines set forth standards for the adequacy of environmental analysis. Guidelines Section 15151 states:

An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection, but for adequacy, completeness, and a good-faith effort at full disclosure.

In this case, the basic question is whether the underlying analysis of air quality impacts made the EIR "sufficient" as an informative document. However, whether the EIR's analysis was sufficient is judged in light of what was reasonably feasible. This represents a mixed question of fact and law that is governed by two different standards of review.

¹³ Friant Ranch actually states that the claim that an EIR lacks sufficient relevant information is, "most properly thought of as raising mixed questions of fact and law." (Opening Brief, p. 27.) However, the remainder of its argument claims that the court should apply the substantial evidence standard of review to all aspects of the issue.

¹⁴ Mixed questions of fact and law issues may implicate predominantly factual subordinate questions that are reviewed under the substantial evidence test even though the ultimate question may be reviewed by the independent judgment test. *Crocker National Bank v. City and County of San Francisco* (1989) 49 Cal.3d 881, 888-889.

SCAQMD submits that an EIR's sufficiency as an informational document is ultimately a legal question that courts should determine using their independent judgment. This Court's language in *Laurel Heights I* supports this position. As this Court explained: "The court does not pass upon the correctness of the EIR's environmental conclusions, but only upon its *sufficiency as an informative document*." (*Laurel Heights I, supra*, 47 Cal.3d at 392-393) (emphasis added.) As described above, the Court in *Vineyard Area Citizens v. City of Rancho Cordova, supra*, 40 Cal.4th at 431, also used its independent judgment to determine what level of analysis CEQA requires for water supply impacts. The Court did not defer to the lead agency's opinion regarding the law's requirements; rather, it determined for itself what level of analysis was necessary to meet "[t]he law's informational demands." (*Id.* at p. 432.) Further, existing case law also holds that where an agency fails to comply with CEQA's information disclosure requirements, the agency has "failed to proceed in the manner required by law." (*Save Our Peninsula Comm. v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 118.)

However, whether an EIR satisfies CEQA's requirements depends in part on whether it was reasonably feasible for an agency to conduct additional or more thorough analysis. EIRs must contain "a detailed statement" of a project's impacts (Pub. Res. Code § 21061), and an agency must "use its best efforts to find out and disclose all that it reasonably can." (CEQA Guidelines § 15144.) Nevertheless, "the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible." (CEQA Guidelines § 15151.)

SCAQMD submits that the question of whether additional analysis or a particular study suggested by a commenter is "feasible" is generally a question of fact. Courts have already held that whether a particular alternative is "feasible" is reviewed by the substantial evidence test.

(*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 598-99; *Center for Biological Diversity v. County of San Bernardino* (2010) 185 Cal.App.4th 866, 883.) Thus, if a lead agency determines that a particular study or analysis is infeasible, that decision should generally be judged by the substantial evidence standard. However, SCAQMD urges this Court to hold that lead agencies must explain the basis of any determination that a particular analysis is infeasible in the EIR itself. An EIR must discuss information, including issues related to the feasibility of particular analyses “in sufficient detail to enable meaningful participation and criticism by the public. ‘[W]hatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what is lacking in the report.’” (*Laurel Heights I, supra*, 47 Cal.3d at p. 405 (quoting *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818, 831) (discussing analysis of alternatives).) The evidence on which the determination is based should also be summarized in the EIR itself, with appropriate citations to reference materials if necessary. Otherwise commenting agencies such as SCAQMD would be forced to guess where the lead agency's evidence might be located, thus thwarting effective public participation.

Moreover, if a lead agency determines that a particular study or analysis would not result in reliable or useful information and for that reason is not feasible, that determination should be judged by the substantial evidence test. (See *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority, supra*, 57 Cal.4th 439, 448, 457:

whether “existing conditions” baseline would be misleading or uninformative judged by substantial evidence standard.¹⁵)

If the lead agency’s determination that a particular analysis or study is not feasible is supported by substantial evidence, then the agency has not violated CEQA’s information disclosure provisions, since it would be infeasible to provide additional information. This Court’s decisions provide precedent for such a result. For example, this Court determined that the issue of whether the EIR should have included a more detailed discussion of future herbicide use was resolved because substantial evidence supported the agency’s finding that “the precise parameters of future herbicide use could not be predicted.” *Ebbetts Pass Forest Watch v. California Dept. of Forestry & Fire Protection* (2008) 43 Cal.4th 936, 955.

Of course, SCAQMD expects that courts will continue to hold lead agencies to their obligations to consult with, and not to ignore or misrepresent, the views of sister agencies having special expertise in the area of air quality. (*Berkeley Keep Jets Over the Bay v. Board of Port Commissioners* (2007) 91 Cal.App.4th 1344, 1364 n.11.) In some cases, information provided by such expert agencies may establish that the purported evidence relied on by the lead agency is not in fact “substantial”. (*Id.* at pp. 1369-1371.)

In sum, courts retain ultimate responsibility to determine what CEQA requires. However, the law does not require exhaustive analysis, but only what is reasonably feasible. Agencies deserve deference for their factual determinations regarding what type of analysis is reasonably feasible. On the other hand, if a commenter requests more information, and the lead agency declines to provide it but does *not* determine that the

¹⁵ The substantial evidence standard recognizes that the courts “have neither the resources nor the scientific expertise” to weigh conflicting evidence on technical issues. (*Laurel Heights I, supra*, 47 Cal.3d 376, 393.)

requested study or analysis would be infeasible, misleading or uninformative, the question becomes whether the omission of that analysis renders the EIR inadequate to satisfy CEQA's informational purposes. (*Id.* at pp. 1370-71.) Again, this is predominantly a question of law and should be judged by the de novo or independent judgment standard of review. Of course, this Court has recognized that a "project opponent or reviewing court can always imagine some additional study or analysis that might provide helpful information. It is not for them to design the EIR. That further study...might be helpful does not make it necessary." (*Laurel Heights I, supra*, 47 Cal.3d 376, 415 – see also CEQA Guidelines § 15204(a) [CEQA "does not require a lead agency to conduct every test. . . recommended or demanded by commenters."].) Courts, then, must adjudicate whether an omission of particular information renders an EIR inadequate to serve CEQA's informational purposes.¹⁶

¹⁶ We recognize that there is case law stating that the substantial evidence standard applies to "challenges to the scope of an EIR's analysis of a topic" as well as the methodology used and the accuracy of the data relied on in the document "because these types of challenges involve factual questions." (*Bakersfield Citizens for Local Control v. City of Bakersfield, supra*, 124 Cal.App.4th 1184, 1198, and cases relied on therein.) However, we interpret this language to refer to situations where the question of the scope of the analysis really is factual—that is, where it involves whether further analysis is feasible, as discussed above. This interpretation is supported by the fact that the *Bakersfield* court expressly rejected an argument that a claimed "omission of information from the EIR should be treated as inquiries whether there is substantial evidence supporting the decision approving the project." *Bakersfield, supra*, 124 Cal.App.4th at p. 1208. And the *Bakersfield* court ultimately decided that the lead agency must analyze the connection between the identified air pollution impacts and resulting health impacts, even though the EIR already included some discussion of air-pollution-related respiratory illnesses. *Bakersfield, supra*, 124 Cal.App.4th at p. 1220. Therefore, the court must not have interpreted this question as one of the "scope of the analysis" to be judged by the substantial evidence standard.

B. Friant Ranch's Rationale for Rejecting the Independent Judgment Standard of Review is Unsupported by Case Law.

In its brief, Friant Ranch makes a distinction between cases where a required CEQA topic is not discussed at all (to be reviewed by independent judgment as a failure to proceed in the manner required by law) and cases where a topic is discussed, but the commenter claims the information provided is insufficient (to be judged by the substantial evidence test). (Opening Brief, pp. 13-17.) The Court of Appeal recognized these two types of cases, but concluded that both raised questions of law. (*Sierra Club v. County of Fresno* (2014) 226 Cal.App.4th 704 (superseded by grant of review) 172 Cal.Rptr.3d 271, 290.) We believe the distinction drawn by Friant Ranch is unduly narrow, and inconsistent with cases which have concluded that CEQA documents are insufficient. In many instances, CEQA's requirements are stated broadly, and the courts must interpret the law to determine what level of analysis satisfies CEQA's mandate for providing meaningful information, even though the EIR discusses the issue to some extent.

For example, the CEQA Guidelines require discussion of the existing environmental baseline. In *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 954-955, the lead agency had discussed the environmental baseline by describing historic month-end water levels in the affected lakes. However, the court held that this was not an adequate baseline discussion because it failed to discuss the timing and amounts of past actual water releases, to allow comparison with the proposed project. The court evidently applied the independent judgment test to its decision, even though the agency discussed the issue to some extent.

Likewise, in *Vineyard Area Citizens* (2007) 40 Cal.4th 412, this Court addressed the question of whether an EIR's analysis of water supply impacts complied with CEQA. The parties agreed that the EIR was required to analyze the effects of providing water to the development project, "and that in order to do so the EIR had, in some manner, to identify the planned sources of that water." (*Vineyard Area Citizens, supra*, at p. 428.) However, the parties disagreed as to the level of detail required for this analysis and "what level of uncertainty regarding the availability of water supplies can be tolerated in an EIR" (*Id.*) In other words, the EIR had analyzed water supply impacts for the project, but the petitioner claimed that the analysis was insufficient.

This Court noted that neither CEQA's statutory language or the CEQA Guidelines specifically addressed the question of how precisely an EIR must discuss water supply impacts. (*Id.*) However, it explained that CEQA "states that '[w]hile foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can.'" (*Id.*, [Guidelines § 15144].) The Court used this general principle, along with prior precedent, to elucidate four "principles for analytical adequacy" that are necessary in order to satisfy "CEQA's informational purposes." (*Vineyard Area Citizens, supra*, at p. 430.) The Court did not defer to the agency's determination that the EIR's analysis of water supply impacts was sufficient. Rather, this Court used its independent judgment to determine for itself the level of analysis required to satisfy CEQA's fundamental purposes. (*Vineyard Area Citizens, supra*, at p. 441: an EIR does not serve its purposes where it neglects to explain likely sources of water and "... leaves long term water supply considerations to later stages of the project.")

Similarly, the CEQA Guidelines require an analysis of noise impacts of the project. (Appendix G, “Environmental Checklist Form.”¹⁷) In *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1123, the court held that the lead agency’s noise impact analysis was inadequate even though it had addressed the issue and concluded that the increase would not be noticeable. If the court had been using the substantial evidence standard, it likely would have upheld this discussion.

Therefore, we do not agree that the issue can be resolved on the basis suggested by Friant Ranch, which would apply the substantial evidence standard to *every* challenge to an analysis that addresses a required CEQA topic. This interpretation would subvert the courts’ proper role in interpreting CEQA and determining what the law requires.

Nor do we agree that the Court of Appeal in this case violated CEQA’s prohibition on courts interpreting its provisions “in a manner which imposes procedural or substantive requirements beyond those explicitly stated in this division or in the state guidelines.” (Pub. Resources Code § 21083.1.) CEQA requires an EIR to describe *all* significant impacts of the project on the environment. (Pub. Resources Code § 21100(b)(2); *Vineyard Area Citizens, supra*, at p. 428.) Human beings are part of the environment, so CEQA requires EIRs to discuss a project’s significant impacts on human health. However, except in certain particular circumstances,¹⁸ neither the CEQA statute nor Guidelines specify the precise level of analysis that agencies must undertake to satisfy the law’s requirements. (see, e.g., CEQA Guidelines § 15126.2(a) [EIRs must describe “health and safety problems caused by {a project’s} physical changes”].) Accordingly, courts must interpret CEQA as a whole to

¹⁷ Association of Environmental Professionals, 2015 CEQA Statute and Guidelines (2015) p.287.

¹⁸ E.g., Pub. Resources Code § 21151.8(C)(3)(B)(iii) (requiring specific type of health risk analysis for siting schools).

determine whether a particular EIR is sufficient as an informational document. A court determining whether an EIR's discussion of human health impacts is legally sufficient does not constitute imposing a new substantive requirement.¹⁹ Under Friant Ranch's theory, the above-referenced cases holding a CEQA analysis inadequate would have violated the law. This is not a reasonable interpretation.

IV. COURTS MUST SCRUPULOUSLY ENFORCE THE REQUIREMENTS THAT LEAD AGENCIES CONSULT WITH AND OBTAIN COMMENTS FROM AIR DISTRICTS

Courts must "scrupulously enforce" CEQA's legislatively mandated requirements. (*Vineyard Area Citizens, supra*, 40 Cal.4th 412, 435.) Case law has firmly established that lead agencies must consult with the relevant air pollution control district before conducting an initial study, and must provide the districts with notice of the intention to adopt a negative declaration (or EIR). (*Schenck v. County of Sonoma* (2011) 198 Cal.App.4th 949, 958.) As *Schenck* held, neither publishing the notice nor providing it to the State Clearinghouse was a sufficient substitute for sending notice directly to the air district. (*Id.*) Rather, courts "must be satisfied that [administrative] agencies have fully complied with the procedural requirements of CEQA, since only in this way can the important public purposes of CEQA be protected from subversion." *Schenck*, 198 Cal.App.4th at p. 959 (citations omitted).²⁰

¹⁹ We submit that Public Resources Code Section 21083.1 was intended to prevent courts from, for example, holding that an agency must analyze economic impacts of a project where there are no resulting environmental impacts (see CEQA Guidelines § 15131), or imposing new procedural requirements, such as imposing additional public notice requirements not set forth in CEQA or the Guidelines.

²⁰ Lead agencies must consult air districts, as public agencies with jurisdiction by law over resources affected by the project, *before* releasing an EIR. (Pub. Resources Code §§ 21104(a); 21153.) Moreover, air

Lead agencies should be aware, therefore, that failure to properly seek and consider input from the relevant air district constitutes legal error which may jeopardize their project approvals. For example, the court in *Fall River Wild Trout Foundation v. County of Shasta*, (1999) 70 Cal.App.4th 482, 492 held that the failure to give notice to a trustee agency (Department of Fish and Game) was prejudicial error requiring reversal. The court explained that the lack of notice prevented the Department from providing any response to the CEQA document. (*Id.* at p. 492.) It therefore prevented relevant information from being presented to the lead agency, which was prejudicial error because it precluded informed decision-making. (*Id.*)²¹

districts should be considered “state agencies” for purposes of the requirement to consult with “trustee agencies” as set forth in Public Resources Code § 20180.3(a). This Court has long ago held that the districts are not mere “local agencies” whose regulations are superseded by those of a state agency regarding matters of statewide concern, but rather have concurrent jurisdiction over such issues. (*Orange County Air Pollution Control District v. Public Util. Com.* (1971) 4 Cal.3d 945, 951, 954.) Since air pollution is a matter of statewide concern, *Id.* at 952, air districts should be entitled to trustee agency status in order to ensure that this vital concern is adequately protected during the CEQA process.

²¹ In *Schenck*, the court concluded that failure to give notice to the air district was not prejudicial, but this was partly because the trial court had already corrected the error before the case arrived at the Court of Appeal. The trial court issued a writ of mandate requiring the lead agency to give notice to the air district. The air district responded by concurring with the lead agency that air impacts were not significant. (*Schenck*, 198 Cal.App.4th 949, 960.) We disagree with the *Schenck* court that the failure to give notice to the air district would not have been prejudicial (even in the absence of the trial court writ) merely because the lead agency purported to follow the air district’s published CEQA guidelines for significance. (*Id.*, 198 Cal.App.4th at p. 960.) In the first place, absent notice to the air district, it is uncertain whether the lead agency properly followed those guidelines. Moreover, it is not realistic to expect that an air district’s published guidelines would necessarily fully address all possible air-quality related issues that can arise with a CEQA project, or that those

Similarly, lead agencies must obtain additional information requested by expert agencies, including those with jurisdiction by law, if that information is necessary to determine a project's impacts. (*Sierra Club v. State Bd. Of Forestry* (1994) 7 Cal.4th 1215, 1236-37.) Approving a project without obtaining that information constitutes a failure to proceed in the manner prescribed by CEQA. (*Id.* at p. 1236.)

Moreover, a lead agency can save significant time and money by consulting with the air district early in the process. For example, the lead agency can learn what the air district recommends as an appropriate analysis on the facts of its case, including what kinds of health impacts analysis may be available, and what models are appropriate for use. This saves the lead agency from the need to do its analysis all over again and possibly needing to recirculate the document after errors are corrected, if new significant impacts are identified. (CEQA Guidelines § 15088.5(a).) At the same time, the air district's expert input can help the lead agency properly determine whether another commenter's request for additional analysis or studies is reasonable or feasible. Finally, the air district can provide input on what mitigation measures would be feasible and effective.

Therefore, we suggest that this Court provide guidance to lead agencies reminding them of the importance of consulting with the relevant air districts regarding these issues. Otherwise, their feasibility decisions may be vulnerable to air district evidence that establishes that there is no substantial evidence to support the lead agency decision not to provide specific analysis. (*See Berkeley Keep Jets Over the Bay, supra*, 91 Cal.App.4th 1344, 1369-1371.)

guidelines would necessarily be continually modified to reflect new developments. Therefore we believe that, had the trial court not already ordered the lead agency to obtain the air district's views, the failure to give notice would have been prejudicial, as in *Fall River, supra*, 70 Cal.App.4th 482, 492.

CONCLUSION

The SCAQMD respectfully requests this Court *not* to establish a hard-and-fast rule concerning whether CEQA requires a lead agency to correlate identified air quality impacts of a project with resulting health outcomes. Moreover, the question of whether an EIR is “sufficient as an informational document” is a mixed question of fact and law containing two levels of inquiry. Whether a particular proposed analysis is feasible is predominantly a question of fact to be judged by the substantial evidence standard of review. Where the requested analysis is feasible, but the lead agency relies on legal or policy reasons not to provide it, the question of whether the EIR is nevertheless sufficient as an informational document is predominantly a question of law to be judged by the independent judgment standard of review.

Respectfully submitted,

SOUTH COAST AIR QUALITY
MANAGEMENT DISTRICT
KURT R. WIESE, GENERAL COUNSEL
BARBARA BAIRD, CHIEF DEPUTY COUNSEL

By: 

Barbara Baird

Attorneys for Amicus Curiae

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

CERTIFICATE OF WORD COUNT

Pursuant to Rule 8.520(c)(1) of the California Rules of Court, I hereby certify that this brief contains 8,476 words, including footnotes, but excluding the Application, Table of Contents, Table of Authorities, Certificate of Service, this Certificate of Word Count, and signature blocks. I have relied on the word count of the Microsoft Word Vista program used to prepare this Certificate.

DATED: April 3, 2015

Respectfully submitted,

Barbara Baird

PROOF OF SERVICE

I am employed in the County of Los Angeles, California. I am over the age of 18 years and not a party to the within action. My business address is 21865 Copley Drive, Diamond Bar, California 91765.

On April 3, 2015 I served true copies of the following document(s) described as **APPLICATION OF THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT FOR LEAVE TO FILE BRIEF OF *AMICUS CURIAE* IN SUPPORT OF NEITHER PARTY AND [PROPOSED] BRIEF OF *AMICUS CURIAE*** by placing a true copy of the foregoing document(s) in a sealed envelope addressed as set forth on the attached service list as follows:

BY MAIL: I enclosed the document(s) in a sealed envelope or package addressed to the persons at the addresses listed in the Service List and placed the envelope for collection and mailing following our ordinary business practices. I am readily familiar with this District's practice for collection and processing of correspondence for mailing. Under that practice, the correspondence would be deposited with the United States Postal Service, with postage thereon fully prepaid at Diamond Bar, California, in the ordinary course of business. I am aware that on motion of the party served, service is presumed invalid if postal cancellation date or postage meter date is more than one day after date of deposit for mailing in affidavit.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed on April 3, 2015 at Diamond Bar, California.

Patricia Anderson

EXECUTIVE SUMMARY

This report evaluates the potential health risk impacts to sensitive receptors (which are residents) and adjacent workers associated with the development of the proposed Project, more specifically, health risk impacts as a result of exposure to Toxic Air Contaminants (TACs) including diesel particulate matter (DPM) as a result of heavy-duty diesel trucks accessing the site. This section summarizes the significance criteria and Project health risks.

The results of the health risk assessment (HRA) of lifetime cancer risk from Project-generated TAC emissions are provided in Table ES-1.

Individual Exposure Scenario:

The residential land use with the greatest potential exposure to Project TAC source emissions is Location R3, which represents the existing residence, at 1153 North Loma Vista Drive, approximately 936 feet southeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receptor R3 is placed at the building façade. At the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to Project TAC source emissions is estimated at 0.11 in one million, which is less than the South Coast Air Quality Management District's (SCAQMD's) significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. Because all other modeled residential receptors are exposed to lesser concentrations and are located at a greater distance from the Project site and primary truck route than the MEIR analyzed herein, and TACs generally dissipates with distance from the source, all other residential receptors in the vicinity of the Project site would be exposed to less emissions and therefore less risk than the MEIR identified herein. As such, the Project will not cause a significant human health or cancer risk to nearby residences.

Worker Exposure Scenario:

The worker receptor land use with the greatest potential exposure to Project TAC source emissions is Location R5, which represents the Urban Element Design, Inc. manufacturing facility, at 806 West 14th Street, located approximately 58 feet east of the Project site. R5 is placed at the building façade where a worker could remain for a typical workday. At the maximally exposed individual worker (MEIW), the maximum incremental cancer risk impact is 0.07 in one million which is less than the SCAQMD's threshold of 10 in one million. Maximum non-cancer risks at this same location were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. Because all other modeled worker receptors are located at a greater distance than the MEIW analyze herein, and DPM dissipates with distance from the source, all other worker receptors in the vicinity of the Project would be exposed to less emissions and therefore less risk than the MEIW identified herein. As such, the Project will not cause a significant human health or cancer risk to adjacent workers.

School Child Exposure Scenario:

There are no schools located within a ¼ mile of the Project site. As such, there would be no significant impacts that would occur to any schools in the vicinity of the Project.

Proximity to sources of toxics is critical to determining the impact. In traffic-related studies, the additional non-cancer health risk attributable to proximity was seen within 1,000 feet and was strongest within 300 feet. California freeway studies show about a 70-percent drop-off in particulate pollution levels at 500 feet. Based on California Air Resources Board (CARB) and SCAQMD emissions and modeling analyses, an 80-percent drop-off in pollutant concentrations is expected at approximately 1,000 feet from a distribution center (1).

The 1,000-foot evaluation distance is supported by research-based findings concerning Toxic Air Contaminant (TAC) emission dispersion rates from roadways and large sources showing that emissions diminish substantially between 500 and 1,000 feet from emission sources.

For purposes of this assessment, a one-quarter mile radius or 1,320 feet geographic scope is utilized for determining potential impacts to nearby schools. This radius is more robust than, and therefore provides a more health protective scenario for evaluation than the 1,000-foot impact radius identified above.

TABLE ES-1: SUMMARY OF CANCER AND NON-CANCER RISKS

Time Period	Location	Maximum Lifetime Cancer Risk (Risk per Million)	Significance Threshold (Risk per Million)	Exceeds Significance Threshold
30 Year Exposure	Maximum Exposed Individual Receptor	0.11	10	NO
25 Year Exposure	Maximum Exposed Worker Receptor	0.07	10	NO
Time Period	Location	Maximum Hazard Index	Significance Threshold	Exceeds Significance Threshold
Annual Average	Maximum Exposed Sensitive Receptor	<0.01	1.0	NO
Annual Average	Maximum Exposed Worker Receptor	<0.01	1.0	NO

1 INTRODUCTION

The South Coast Air Quality Management District (SCAQMD) typically issues a comment letter on the Notice of Preparation of a CEQA Document. Per the SCAQMD's typical comment letter, if a proposed Project is expected to generate/attract diesel trucks, which emit diesel particulate matter (DPM) or other Toxic Air Contaminants (TACs), preparation of a HRA is necessary. This document serves to meet the SCAQMD's request for preparation of a HRA. This HRA has been prepared in accordance with the document Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (2) and is comprised of all relevant and appropriate procedures presented by the United States Environmental Protection Agency (U.S. EPA), California EPA and SCAQMD. Cancer risk is expressed in terms of expected incremental incidence per million population. The SCAQMD has established an incidence rate of ten (10) persons per million as the maximum acceptable incremental cancer risk due to TAC exposure from a project such as the proposed Project. This threshold serves to determine whether or not a given project has a potentially significant development-specific and cumulatively considerable impact.

The AQMD has published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution* (3). In this report the AQMD states (Page D-3):

"...the AQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for toxic air contaminant (TAC) emissions. The project specific (project increment) significance threshold is $HI > 1.0$ while the cumulative (facility-wide) is $HI > 3.0$. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.

Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

The SCAQMD has also established non-carcinogenic risk parameters for use in HRAs. Non-carcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index less than one (1.0) means that adverse health effects are not expected. In this HRA, non-carcinogenic exposures of less than 1.0 are considered less-than-significant. Both the cancer risk and non-carcinogenic risk thresholds are applied to the nearest sensitive receptors below.

1.1 SITE LOCATION

The proposed Project is located on the southwest corner of San Francisco Avenue and Anaheim Street in the City of Long Beach, as shown on Exhibit 1-A. Existing land uses near the site include nearby residences located east and southeast of the Project site. The Los Angeles River is located to the west of the Project site.

1.2 PROJECT DESCRIPTION

The proposed Project is to consist of two warehouse buildings totaling 123,595 square feet (sf) with Building 1 at 62,042 square feet, Building 2 at 61,553 square feet, and an existing 5,827 square foot building (to remain) as shown on Exhibit 1-B. For the purposes of this assessment, the mix of uses for the Project is assumed to consist of 61,797 square feet of warehousing use (no less than 50% warehousing use anticipated) and 61,798 square feet of general light industrial use (remaining 50% of the total square footage). The Project is anticipated to be open by the year 2022.

As summarized in the *San Francisco Avenue Trip Generation Assessment (TGA)*, the Project is expected to generate approximately 308 two-way vehicular trips (154 inbound and 154 outbound) which includes 26 two-way truck trips per day (13 inbound and 13 outbound) associated with the General Light Industrial land use and approximately 108 two-way vehicular trips (54 inbound and 54 outbound) which includes 30 two-way truck trips per day (15 inbound and 15 outbound) associated with the Warehouse land use (4).

2 BACKGROUND

2.1 BACKGROUND ON RECOMMENDED METHODOLOGY

This HRA is based on SCAQMD guidelines to produce conservative estimates of human health risk posed by exposure to DPM. The conservative nature of this analysis is due primarily to the following factors:

- The ARB-adopted diesel exhaust Unit Risk Factor (URF) of 300 in one million per $\mu\text{g}/\text{m}^3$ is based upon the upper 95 percentile of estimated risk for each of the epidemiological studies utilized to develop the URF. Using the 95th percentile URF represents a very conservative (health-protective) risk posed by DPM because it represents breathing rates that are high for the human body (95% higher than the average population).
- The emissions derived assume that every truck accessing the Project site will idle for 15 minutes under the unmitigated scenario, and this is an overestimation of actual idling times and thus conservative.¹ The California Air Resources Board (CARB's) anti-idling requirements impose a 5-minute maximum idling time and therefore the analysis conservatively overestimates DPM emissions from idling by a factor of 3.

2.2 EMISSIONS ESTIMATION

2.2.1 ON-SITE AND OFF-SITE TRUCK ACTIVITY

Vehicle DPM emissions were calculated using emission factors for particulate matter less than $10\mu\text{m}$ in diameter (PM_{10}) generated with the 2017 version of the Emission FACtor model (EMFAC) developed by the CARB. EMFAC 2017 is a mathematical model that CARB developed to calculate emission rates from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by the ARB to project changes in future emissions from on-road mobile sources (6). The most recent version of this model, EMFAC 2017, incorporates regional motor vehicle data, information and estimates regarding the distribution of vehicle miles traveled (VMT) by speed, and number of starts per day.

Several distinct emission processes are included in EMFAC 2017. Emission factors calculated using EMFAC 2017 are expressed in units of grams per vehicle miles traveled (g/VMT) or grams per idle-hour (g/idle-hr), depending on the emission process. The emission processes and corresponding emission factor units associated with diesel particulate exhaust for this Project are presented below.

For this Project, annual average PM_{10} emission factors were generated by running EMFAC 2017 in EMFAC Mode for vehicles in the Riverside County jurisdiction. The EMFAC Mode generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of temperature, relative humidity, and vehicle speed.

¹ Although the Project is required to comply with ARB's idling limit of 5 minutes, staff at SCAQMD recommends that the on-site idling emissions should be estimated for 15 minutes of truck idling (personal communication, in person, with Jillian Wong, December 22, 2016), which would take into account on-site idling which occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc.

The model was run for speeds traveled in the vicinity of the Project. The vehicle travel speeds for each segment modeled are summarized below.

- Idling – on-site loading/unloading and truck gate
- 5 miles per hour – on-site vehicle movement including driving and maneuvering
- 25 miles per hour – off-site vehicle movement including driving and maneuvering.

Calculated emission factors are shown at Table 2-1. As a conservative measure, a 2022 EMFAC 2017 run was conducted and a static 2022 emissions factor data set was used for the entire duration of analysis herein (e.g., 30 years). Use of 2022 emission factors would overstate potential impacts since this approach assumes that emission factors remain “static” and do not change over time due to fleet turnover or cleaner technology with lower emissions that would be incorporated into vehicles after 2022. Additionally, based on EMFAC 2017, Light-Heavy-Duty Trucks are comprised of 38.1% diesel, Medium-Heavy-Duty Trucks are comprised of 81.9% diesel, and Heavy-Heavy-Duty Trucks are comprised of 95.6% diesel. Trucks fueled by diesel are accounted for by these percentages accordingly in the emissions factor generation. Appendix 2.1 includes additional details on the emissions estimates from EMFAC.

The vehicle DPM exhaust emissions were calculated for running exhaust emissions. The running exhaust emissions were calculated by applying the running exhaust PM₁₀ emission factor (g/VMT) from EMFAC over the total distance traveled. The following equation was used to estimate off-site emissions for each of the different vehicle classes comprising the mobile sources (7):

$$\text{Emissions}_{\text{speedA}} \text{ (g/s)} = \text{EF}_{\text{RunExhaust}} \text{ (g/VMT)} * \text{Distance (VMT/trip)} * \text{Number of Trips (trips/day)} / \text{seconds per day}$$

Where:

$\text{Emissions}_{\text{speedA}}$ (g/s): Vehicle emissions at a given speed A;

$\text{EF}_{\text{RunExhaust}}$ (g/VMT): EMFAC running exhaust PM₁₀ emission factor at speed A;

Distance (VMT/trip): Total distance traveled per trip.

Similar to off-site traffic, on-site vehicle running emissions were calculated by applying the running exhaust PM₁₀ emission factor (g/VMT) from EMFAC and the total vehicle trip number over the length of the driving path using the same formula presented above for on-site emissions. In addition, on-site vehicle idling exhaust emissions were calculated by applying the idle exhaust PM₁₀ emission factor (g/idle-hr) from EMFAC and the total truck trip over the total assumed idle time (15 minutes). The following equation was used to estimate the on-site vehicle idling emissions for each of the different vehicle classes (7):

$$\text{Emissions}_{\text{idle}} \text{ (g/s)} = \text{EF}_{\text{idle}} \text{ (g/hr)} * \text{Number of Trips (trips/day)} * \text{Idling Time (min/trip)} * \frac{60 \text{ minutes}}{\text{per hour}} / \text{seconds per day}$$

Where:

Emissions_{idle} (g/s): Vehicle emissions during idling;

EF_{idle} (g/s): EMFAC idle exhaust PM₁₀ emission factor.

TABLE 2-1: 2022 WEIGHTED AVERAGE DPM EMISSIONS FACTORS

Speed	Weighted Average
0 (idling)	0.08122 (g/idle-hr)
5	0.03999 (g/s)
25	0.01781 (g/s)

Each roadway was modeled as a line source (made up of multiple adjacent volume sources). Due to the large number of volume sources modeled for this analysis, the corresponding coordinates of each volume source have not been included in this report but are included in Appendix 2.2. The DPM emission rate for each volume source was calculated by multiplying the emission factor (based on the average travel speed along the roadway) by the number of trips and the distance traveled along each roadway segment and dividing the result by the number of volume sources along that roadway, as illustrated on Table 2-2. The modeled emission sources are illustrated on Exhibit 2-A. The modeling domain is limited to the Project's primary truck route and includes off-site sources in the study area for more than 1 mile. This modeling domain is more inclusive and conservative than using only a ¼ mile modeling domain which is the distance supported by several reputable studies which conclude that the greatest potential risks occur within a ¼ mile of the primary source of emissions (1) (in the case of the Project, the primary source of emissions is the on-site idling and on-site travel).

On-site truck idling was estimated to occur as trucks enter and travel through the Project site. Although the Project's diesel-fueled truck and equipment operators will be required by State law to comply with CARB's idling limit of 5 minutes, staff at SCAQMD recommends that the on-site idling emissions be calculated assuming 15 minutes of truck idling (8), which would take into account on-site idling which occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc. As such, this analysis calculates truck idling at 15 minutes, consistent with SCAQMD's recommendation.

As summarized in the TGA, the Project is expected to generate a total of approximately 490 two-way vehicular trips per day (245 inbound and 245 outbound) which includes 56 two-way truck trips per day (28 inbound and 28 outbound). DPM-related impacts are associated with diesel exhaust from the 56 two-way truck trips per day generated by the Project (4).

EXHIBIT 2-A: MODELED EMISSION SOURCES

TABLE 2-2: DPM EMISSIONS FROM PROJECT TRUCKS (2022 ANALYSIS YEAR)

Truck Emission Rates						
Source	Trucks Per Day	VMT ^a (miles/day)	Truck Emission Rate ^b (grams/mile)	Truck Emission Rate ^b (grams/idle-hour)	Daily Truck Emissions ^c (grams/day)	Modeled Emission Rates (g/second)
On-Site Idling Building 1	14			0.0812	0.28	3.290E-06
On-Site Idling Building 2	14			0.0812	0.28	3.290E-06
On-Site Travel Building 1	28	3.39	0.0400		0.14	1.568E-06
On-Site Travel Building 2	28	1.84	0.0400		0.07	8.505E-07
Off-Site Travel	56	41.35	0.0178		0.74	8.523E-06

^a Vehicle miles traveled are for modeled truck route only.

^b Emission rates determined using EMFAC 2017. Idle emission rates are expressed in grams per idle hour rather than grams per mile.

^c This column includes the total truck travel and truck idle emissions. For idle emissions this column includes emissions based on the assumption that each truck idles for 15 minutes.

2.3 EXPOSURE QUANTIFICATION

The analysis herein has been conducted in accordance with the guidelines in the Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (2). SCAQMD recommends using the Environmental Protection Agency's (U.S. EPA's) AERMOD model. For purposes of this analysis, the Lakes AERMOD View (Version 9.9.0) was used to calculate annual average particulate concentrations associated with site operations. Lakes AERMOD View was utilized to incorporate the U.S. EPA's latest AERMOD Version 19191 (9).

The model offers additional flexibility by allowing the user to assign an initial release height and vertical dispersion parameters for mobile sources representative of a roadway. For this HRA, the roadways were modeled as adjacent volume sources. Roadways were modeled using the U.S. EPA's haul route methodology for modeling of on-site and off-site truck movement. More specifically, the Haul Road Volume Source Calculator in Lakes AERMOD View has been utilized to determine the release height parameters. Based on the US EPA methodology, the Project's modeled sources would result in a release height of 3.49 meters, and an initial lateral dimension of 4.0 meters, and an initial vertical dimension of 3.25 meters.

SCAQMD-recommended model parameters are presented in Table 2-3 (10). The model requires additional input parameters including emission data and local meteorology. Meteorological data from the SCAQMD's Long Beach monitoring station (SRA 4) was used to represent local weather conditions and prevailing winds (11). A wind rose exhibit of the Long Beach monitoring station is provided at Exhibit 2-B.

TABLE 2-3: AERMOD MODEL PARAMETERS

Dispersion Coefficient (Urban/Rural)	Urban (Population 9,818,605)
Terrain (Flat/Elevated)	Elevated (Regulatory Default)
Averaging Time	1 year (5-year Meteorological Data Set)
Receptor Height	0 meters (Regulatory Default)

Universal Transverse Mercator (UTM) coordinates for World Geodetic System (WGS) 84 were used to locate the Project site boundaries, each volume source location, and receptor locations in the Project site's vicinity. The AERMOD dispersion model summary output files for the proposed Project are presented in Appendix 2.2. Modeled sensitive receptors were placed at residential and non-residential locations.

EXHIBIT 2-B: WIND ROSE (SRA 4)

Receptors may be placed at applicable structure locations for residential and worker property and not necessarily the boundaries of the properties containing these uses because the human receptors (residents and workers) spend a majority of their time at the residence or in the workplace's building, and not on the property line. It should be noted that the primary purpose of receptor placement is focused on long-term exposure. For example, the HRA evaluates the potential health risks to residents and workers over a period of 30 or 25 years of exposure, respectively. Notwithstanding, as a conservative measure, receptors were placed at either the outdoor living area or the building façade, whichever is closer to the Project site.

For purposes of this HRA, receptors include both residential and non-residential (worker) land uses in the vicinity of the Project. These receptors are included in the HRA since residents and workers may be exposed at these locations over a long-term duration of 30 and 25 years, respectively. This methodology is consistent with SCAQMD and OEHHA recommended guidance.

Any impacts to residents or workers located further away from the Project site than the modeled residential and workers would have a lesser impact than what has already been disclosed in the HRA at the MEIR and MEIW because concentrations dissipate with distance.

Consistent with SCAQMD modeling guidance, all receptors were set to existing elevation height so that only ground-level concentrations are analyzed (12). United States Geological Survey (USGS) Digital Elevation Model (DEM) terrain data based on a 7.5-minute topographic quadrangle map series using AERMAP was utilized in the HRA modeling to set elevations.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines. Tables 2-4 and 2-5 summarize the Exposure Parameters for Residents and Workers based on 2015 OEHHA Guidelines. Appendix 2.3 includes the detailed risk calculation.

TABLE 2-4: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (30 YEAR RESIDENTIAL)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
-0.25 to 0	361	10	0.25	0.85	350	24
0 to 2	1090	10	2	0.85	350	24
2 to 16	572	3	14	0.72	350	24
16 to 30	261	1	14	0.73	350	24

TABLE 2-5: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (25 YEAR WORKER)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Exposure Frequency (days/year)	Exposure Time (hours/day)
16 to 41	230	1	25	250	12

2.4 CARCINOGENIC CHEMICAL RISK

The SCAQMD CEQA Air Quality Handbook (1993) states that emissions of toxic air contaminants (TACs) are considered significant if a HRA shows an increased risk of greater than 10 in one million. Based on guidance from the SCAQMD in the document Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (2), for purposes of this analysis, 10 in one million is used as the cancer risk threshold for the proposed Project.

Excess cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens over a specified exposure duration. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). A risk level of 10 in one million implies a likelihood that up to 10 people, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time.

Guidance from CARB and the California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (OEHHA) recommends a refinement to the standard point estimate approach when alternate human body weights and breathing rates are utilized to assess risk for susceptible subpopulations such as children. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose. Once determined, contaminant dose is multiplied by the cancer potency factor (CPF) in units of inverse dose expressed in milligrams per kilogram per day (mg/kg/day)⁻¹ to derive the cancer risk estimate. Therefore, to assess exposures, the following dose algorithm was utilized.

$$\text{DOSE}_{\text{air}} = (\text{C}_{\text{air}} \times [\text{BR}/\text{BW}] \times A \times \text{EF}) \times (1 \times 10^{-6})$$

Where:

DOSE _{air}	=	chronic daily intake (mg/kg/day)
C _{air}	=	concentration of contaminant in air (ug/m ³)
[BR/BW] BW-day)	=	daily breathing rate normalized to body weight (L/kg BW-day)
A	=	inhalation absorption factor
EF	=	exposure frequency (days/365 days)
BW	=	body weight (kg)
1 x 10 ⁻⁶	=	conversion factors (ug to mg, L to m ³)
RISK _{air} = DOSE _{air} x CPF x ED/AT		

Where:

DOSE _{air}	=	chronic daily intake (mg/kg/day)
CPF	=	cancer potency factor
ED	=	number of years within particular age group
AT	=	averaging time

2.5 NON-CARCINOGENIC EXPOSURES

An evaluation of the potential noncarcinogenic effects of chronic exposures was also conducted. Adverse health effects are evaluated by comparing a compound's annual concentration with its toxicity factor or Reference Exposure Level (REL). The REL for diesel particulates was obtained from OEHHA for this analysis. The chronic reference exposure level (REL) for DPM was established by OEHHA as 5 µg/m³ (OEHHA Toxicity Criteria Database, <http://www.oehha.org/risk/chemicaldb/index.asp>).

The non-cancer hazard index was calculated (consistent with SCAQMD methodology) as follows:

The relationship for the non-cancer health effects of DPM is given by the following equation:

$$\text{HI}_{\text{DPM}} = \text{C}_{\text{DPM}} / \text{REL}_{\text{DPM}}$$

Where:

HI _{DPM}	=	Hazard Index; an expression of the potential for non-cancer health effects.
C _{DPM}	=	Annual average DPM concentration (µg/m ³).

$REL_{DPM} =$ Reference exposure level (REL) for DPM; the DPM concentration at which no adverse health effects are anticipated.

For purposes of this analysis the hazard index for the respiratory endpoint totaled less than one for all receptors in the project vicinity, and thus is less than significant.

2.6 POTENTIAL PROJECT-RELATED TAC SOURCE CANCER AND NON-CANCER RISKS

Individual Exposure Scenario:

The residential land use with the greatest potential exposure to Project TAC source emissions is Location R3, which represents the existing residence, at 1153 North Loma Vista Drive, approximately 936 feet southeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receptor R3 is placed at the building façade. At the MEIR, the maximum incremental cancer risk attributable to Project TAC source emissions is estimated at 0.11 in one million, which is less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. Because all other modeled residential receptors are exposed to lesser concentrations and are located at a greater distance from the Project site and primary truck route than the MEIR analyzed herein, and TACs generally dissipates with distance from the source, all other residential receptors in the vicinity of the Project site would be exposed to less emissions and therefore less risk than the MEIR identified herein. As such, the Project will not cause a significant human health or cancer risk to nearby residences. The nearest modeled receptors are illustrated on Exhibit 2-C.

Worker Exposure Scenario²:

The worker receptor land use with the greatest potential exposure to Project TAC source emissions is Location R5, which represents the Urban Element Design, Inc. manufacturing facility, at 806 West 14th Street, located approximately 58 feet east of the Project site. R5 is placed at the building façade where a worker could remain for a typical workday. At the MEIW, the maximum incremental cancer risk impact is 0.07 in one million which is less than the SCAQMD's threshold of 10 in one million. Maximum non-cancer risks at this same location were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. Because all other modeled worker receptors are located at a greater distance than the MEIW analyze herein, and DPM dissipates with distance from the source, all other worker receptors in the vicinity of the Project would be exposed to less emissions and therefore less risk than the MEIW identified herein. As such, the Project will not cause a significant human health or cancer risk to adjacent workers. The nearest modeled receptors are illustrated on Exhibit 2-C.

2 SCAQMD guidance does not require assessment of the potential health risk to on-site workers. Excerpts from the document OEHHA Air Toxics Hot Spots Program Risk Assessment Guidelines—The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2003), also indicate that it is not necessary to examine the health effects to on-site workers unless required by RCRA (Resource Conservation and Recovery Act) / CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) or the worker resides on-site.

School Child Exposure Scenario:

There are no schools located within a ¼ mile of the Project site. As such, there would be no significant impacts that would occur to any schools in the vicinity of the Project.

Proximity to sources of toxics is critical to determining the impact. In traffic-related studies, the additional non-cancer health risk attributable to proximity was seen within 1,000 feet and was strongest within 300 feet. California freeway studies show about a 70-percent drop-off in particulate pollution levels at 500 feet. Based on California Air Resources Board (CARB) and SCAQMD emissions and modeling analyses, an 80-percent drop-off in pollutant concentrations is expected at approximately 1,000 feet from a distribution center (1).

The 1,000-foot evaluation distance is supported by research-based findings concerning Toxic Air Contaminant (TAC) emission dispersion rates from roadways and large sources showing that emissions diminish substantially between 500 and 1,000 feet from emission sources.

For purposes of this assessment, a one-quarter mile radius or 1,320 feet geographic scope is utilized for determining potential impacts to nearby schools. This radius is more robust than, and therefore provides a more health protective scenario for evaluation than the 1,000-foot impact radius identified above.

*** MODELOPTs: RegDEFAULT CONC ELEV URBAN ADJ_U*

*** MODEL SETUP OPTIONS SUMMARY

-- --
**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 183 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 9818605.0 ; Urban Roughness Length = 1.000 m

**Model Uses Regulatory DEFAULT Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:

ADJ_U* - Use ADJ_U* option for SBL in AERMET

CCVR_Sub - Meteorological data includes CCVR substitutions

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: DPM

**Model Calculates ANNUAL Averages Only

**This Run Includes: 183 Source(s); 1 Source Group(s); and 6

Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 183 VOLUME source(s)
and: 0 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of ANNUAL Averages by Receptor

Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)

Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing
Hours
b for Both Calm
and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 10.00 ; Decay
Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ;
Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: 13987 HRA.ERR

**File for Summary of Results: 13987 HRA.SUM

BIOLOGICAL SURVEY

This page intentionally left blank

HARMSWORTH ASSOCIATES

Environmental Consultants

March 30, 2021

Clark Neuhoff
Alere Property Group
100 Bayview Circle, Suite 310
Newport Beach, CA 92660

Dear Mr. Neuhoff:

Re: San Francisco Avenue Project Biological Survey

This letter report presents the findings of a biological constraints survey conducted at the San Francisco Avenue project site. The site consists of two adjacent properties located at 1401 San Francisco Avenue and 929 Anaheim Street, Long Beach, Los Angeles County, California. The assessment was conducted under contract to Alere Property Group. In March 2021, Harmsworth Associates biologist Paul Galvin, conducted surveys and a biological assessment of the project site to evaluate potential biological constraints and to document existing site conditions.

Project location and project description

The project is located in Long Beach, Los Angeles County, California; and is located within the Long Beach USGS 7.5 minute quadrangle (Figures 1-3). The proposed project consists of two adjacent properties; located at 1401 San Francisco Avenue and 929 Anaheim Street. The Los Angeles River is located to the west and San Francisco Avenue to the east. The site and vicinity is in a developed portion of Long Beach city. The site is separated from the Los Angeles River by a bike trail.

The project is a re-development and consists of development of two new office/warehouse buildings and associated parking spaces on the existing developed lot. Existing structures would be removed as part of the re-development.

Currently the entire project vicinity is flat with an elevation of approximately 11 feet above mean sea level. The entire project site has been paved. The area has a Mediterranean type climate, with hot dry summers and cool relatively wet winters. Annual precipitation for the area is approximately 12.3 inches, and average annual temperature ranges from 55⁰ to 74⁰ F.

Survey methods

The site visit was conducted on 29 March, 2021 by Harmsworth Associate biologist Paul Galvin. The habitat assessment and survey consisted of a general walk-around to all portions of the site, documenting site vegetation; habitats and evidence of wildlife presence.

All areas of the site were surveyed and assessed. Focused surveys for special status plant species¹ and special status wildlife species² were not conducted as part of the surveys. In addition to surveys and habitats assessments existing biological data for the area, such as the California Natural Diversity Data Base (CNDDB 2021) and the California Native Plant Society Inventory of rare and endangered vascular plants of California (Tibor 2001; 6th Edition of CNPS Inventory, CNPS 2021), were reviewed (Photographs 1-8).

Existing site conditions

The entire project area is an existing development in a developed portion of Long Beach city. The entire site is paved or supports existing structures, except for a few very small landscaped areas. The property was an empty lot with two empty buildings.

A small landscaped area existed at the entrance to the 1401 San Francisco Avenue property. There were no natural vegetated areas or undeveloped land. A few non-native weeds grew in cracks in the pavement and the dirt adjacent to the western boundary fence. Weeds present included tree tobacco (*Nicotiana glauca*), brome grasses (*Bromus* spp.), prickly lettuce (*Lactuca serriola*), prickly sow-thistle (*Sonchus asper*), castor bean (*Ricinus communis*), filaree (*Erodium* sp.), California burclover (*Medicago polymorpha*), wild radish (*Raphanus raphanistrum*), trumpet vine (*Campsis* sp.), grape (*Vitis* sp.) and pigweed (*Amaranthus retroflexus*).

Wildlife was sparse due to the lack of native habitats and poor site conditions. Species detected were typical of disturbed/developed areas and included rock dove (*Columba livia*), house sparrow (*Passer domesticus*) and Anna's hummingbird (*Calypte anna*).

Potential issues

Special status species

The site has very limited value to native plants and wildlife due to the disturbed and developed nature of the site and the complete absence of native habitats onsite. The site has no potential to support special status plant or wildlife species (which includes federal and state listed threatened, endangered species, proposed or candidate plant or wildlife species) and no focused surveys for any special status species are required.

Wildlife movement

None of the proposed sites are in areas that could potentially provide movement corridors for wildlife species.

¹ Special status plant species = federal or state listed threatened or endangered species, or proposed endangered, threatened or candidate species, California Native Plant Society Species List (CNPS list 1-4), or otherwise sensitive species.

² Special status wildlife species = federal or state listed threatened or endangered species, or proposed endangered, threatened or candidate species, or otherwise sensitive species.

Federal Migratory Bird Treaty Act of 1918 (MBTA)

The MBTA governs the taking and killing of migratory birds, their eggs, parts, and nests and prohibits the take of any migratory bird, their eggs, parts, and nests. No take of migratory birds is allowed under this act. Construction work at areas with potential to support nesting birds must comply with the MBTA.

Wetlands, Waters of the U.S.

No wetlands or Waters of the U.S. and no areas that would be subject to the jurisdiction of the U.S. Army Corps of Engineers (Corps), California Department of Fish and Wildlife (CDFW) or California Regional Water Quality Control Board (CRWQCB) occur onsite.

Biological constraints

There are no biological constraints at the project site.

MANAGEMENT SUMMARY

BCR Consulting LLC (BCR Consulting) is under contract to Alere Property Group LLC to complete a Cultural Resources Assessment of the proposed 929 West Anaheim Street and 1401 San Francisco Avenue Project (project) in the City of Long Beach (City), Los Angeles County, California. The project occupies approximately 6.21 acres and is bounded by San Francisco Avenue on the east, the channelized Los Angeles River levy on the west, by an industrial property to the north, and Anaheim Street to the south. A cultural resources records search, additional research, intensive-level pedestrian field survey, Sacred Lands File search with the Native American Heritage Commission (NAHC), and vertebrate paleontological resources assessment were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA).

The records search revealed that 20 previous cultural resources studies have taken place, and 23 cultural resources (21 historic-period buildings/structures and two prehistoric archaeological sites) have been recorded within one half-mile of the project site. Three previous studies have assessed the project site, and no cultural resources have been previously recorded within its boundaries. During the field survey, BCR Consulting personnel identified one historic-period industrial warehouse building within the project site boundaries. This building is not recommended eligible for the California Register of Historical Resources (California Register) or as a City Landmark (Long Beach Municipal Code Chapter 2.63.050). As such this resource is not recommended a "historical resource" under CEQA. It does not warrant further consideration. Furthermore, previous construction-related excavation on the project site and disturbances from the channelizing of the Los Angeles River have disturbed sediments beyond depths at which buried prehistoric cultural resources are likely. Based on these results, BCR Consulting recommends that no additional cultural resources work or monitoring is necessary for any proposed project activities. However, if previously undocumented cultural resources are identified during earthmoving activities, a qualified archaeologist shall be contacted to assess the nature and significance of the find, diverting construction excavation if necessary.

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

INTRODUCTION

BCR Consulting LLC (BCR Consulting) is under contract to Alere Property Group LLC to complete a Cultural Resources Assessment of the proposed 929 West Anaheim Street and 1401 San Francisco Avenue Project (project) in the City of Long Beach (City), Los Angeles County, California. A cultural resources records search, additional research, intensive-level pedestrian field survey, Sacred Lands File search with the Native American Heritage Commission (NAHC), and vertebrate paleontological resources assessment were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The project occupies approximately 6.21 acres and is bounded by San Francisco Avenue on the east, the channelized Los Angeles River levy on the west, by an industrial property to the north, and Anaheim Street to the south. The project site is located in a non-sectioned portion of Township 4 South, Range 13 West, San Bernardino Baseline and Meridian. It is depicted on the United States Geological Survey (USGS) *Long Beach, California* (1964) 7.5-minute topographic quadrangle (Figure 1).

NATURAL SETTING

The local geologic region coincides with the physiographic area known as the Los Angeles Basin. It is characterized as a transverse-oriented lowland basin and coastal plain approximately 50 miles long and 20 miles wide. The basin originated as a deep marine trough during the Pliocene (7-2 million years ago) that eventually filled with shallow water fossil bearing sediments. By the beginning of the Pleistocene (after 2 million years ago) uplifting created the series of plains and mesas along the coast that now characterize the area (Lambert 1994, Mendenhall 1905, Woodford et al. 1954). Local rainfall ranges from 5 to 15 inches annually (Jaeger and Smith 1971:36-37). Local vegetation communities are naturally dominated by coastal sage scrub and riparian vegetation, although urbanization prevents its proliferation in much of the project region (Williams et al. 2008:117, 122). See Bean and Saubel (1972) for use of these biotic communities by prehistoric and historic inhabitants. Flood control efforts during the 1930s rerouted the Los Angeles River from one-half mile east, to its current location along the project site's western boundary (Patzert et al. 2014, USGS 1902, USGS 1964). Excavation of the river channel and excavation for building construction on the project site have disturbed sediments beyond depths at which buried cultural resources are likely.

CULTURAL SETTING

Prehistoric Context

The local prehistoric cultural setting has been organized into many chronological frameworks (see Warren and Crabtree 1986; Bettinger and Taylor 1974; Lanning 1963; Hunt 1960; Wallace 1958, 1962, 1978; Campbell and Campbell 1935), although there is no definitive sequence for the region. The difficulties in establishing cultural chronologies for southern California are a function of its enormous size and the small amount of archaeological excavations. Moreover, throughout prehistory many groups have occupied the area and their territories often overlap spatially and chronologically resulting in mixed artifact deposits. Due to dry climate and capricious geological processes, these artifacts rarely become integrated in-situ. Lacking a milieu hospitable to the preservation of cultural midden, local chronologies have relied upon temporally diagnostic artifacts, such as

Figure 1

Alere LLC

projectile points, or upon the presence/absence of other temporal indicators, such as groundstone. Such methods are instructive, but can be limited by prehistoric occupants' Concurrent use of different artifact styles, or by artifact re-use or re-sharpening, as well as researchers' mistaken diagnosis, and other factors (see Flenniken 1985; Flenniken and Raymond 1986; Flenniken and Wilke 1989). Recognizing the shortcomings of comparative temporal indicators, this study recommends review of Warren and Crabtree (1986), who have drawn upon this method to produce a relatively comprehensive chronology.

Ethnography

The Gabrielino probably first encountered Europeans when Spanish explorers reached California's southern coast during the 15th and 16th centuries (Bean and Smith 1978; Kroeber 1925). The first documented encounter, however, occurred in 1769 when Gaspar de Portola's expedition crossed Gabrielino territory (Bean and Smith 1978). Other brief encounters took place over the years, and are documented in McCawley 1996 (citing numerous sources). The Gabrielino name has been attributed by association with the Spanish mission of San Gabriel, and refers to a subset of people sharing speech and customs with other Cupan speakers (such as the Juaneño/Luiseño/Ajachemem) from the greater Takic branch of the Uto-Aztecan language family (Bean and Smith 1978). Gabrielino villages occupied the watersheds of various rivers (locally including the Santa Ana) and intermittent streams. Chiefs were usually descended through the male line and often administered several villages. Gabrielino society was somewhat stratified and is thought to have contained three hierarchically ordered social classes which dictated ownership rights and social status and obligations (Bean and Smith 1978:540-546). Plants utilized for food were heavily relied upon and included acorn-producing oaks, as well as seed-producing grasses and sage. Animal protein was commonly derived from rabbits and deer in inland regions, while coastal populations supplemented their diets with fish, shellfish, and marine mammals (Boscana 1933, Heizer 1968, Johnston 1962, McCawley 1996). Dog, coyote, bear, tree squirrel, pigeon, dove, mud hen, eagle, buzzard, raven, lizards, frogs, and turtles were specifically not utilized as a food source (Kroeber 1925).

History

Historic-era California is generally divided into three periods: the Spanish or Mission Period (1769 to 1821), the Mexican or Rancho Period (1821 to 1848), and the American Period (1848 to present).

Spanish Period. The first European to pass through the area is thought to be a Spaniard called Father Francisco Garces. Having become familiar with the area, Garces acted as a guide to Juan Bautista de Anza, who had been commissioned to lead a group across the desert from a Spanish outpost in Arizona to set up quarters at the Mission San Gabriel in 1771 near what today is Pasadena (Beck and Haase 1974). Garces was followed by Alta California Governor Pedro Fages, who briefly explored the region in 1772. Searching for San Diego Presidio deserters, Fages had traveled through Riverside to San Bernardino, crossed over the mountains into the Mojave Desert, and then journeyed westward to the San Joaquin Valley (Beck and Haase 1974).

Mexican Period. In 1821, Mexico overthrew Spanish rule and the missions began to decline. By 1833, the Mexican government passed the Secularization Act, and the missions, reorganized as parish churches, lost their vast land holdings, and released their neophytes (Beattie and Beattie 1974).

American Period. The American Period, 1848–Present, began with the Treaty of Guadalupe Hidalgo. In 1850, California was accepted into the Union of the United States primarily due to the population increase created by the Gold Rush of 1849. The cattle industry reached its greatest prosperity during the first years of the American Period. Mexican Period land grants had created large pastoral estates in California, and demand for beef during the Gold Rush led to a cattle boom that lasted from 1849–1855. However, beginning about 1855, the demand for beef began to decline due to imports of sheep from New Mexico and cattle from the Mississippi and Missouri Valleys. When the beef market collapsed, many California ranchers lost their ranchos through foreclosure. A series of disastrous floods in 1861–1862, followed by a significant drought further diminished the economic impact of local ranching. This decline combined with ubiquitous agricultural and real estate developments of the late 19th century, set the stage for diversified economic pursuits that continue to this day (Beattie and Beattie 1974; Cleland 1941).

Local Sequence. The Long Beach area was part of the Spanish-era Rancho Los Nietos (originally called La Zanja) granted in 1784 to Jose Manuel Nieto, a soldier from San Diego. The property included 300,000 acres of land that stretched south from present-day Whittier to the ocean. It was eventually cut in half due to claims by the priests of San Gabriel that it encroached on Mission lands. Nieto retired from the Spanish Military in 1795 to focus on ranching activities until his death in 1804. His widow and five children inherited the property, and it was managed by his oldest son Juan Jose. When Mexico gained independence, Rancho Los Nietos was divided among the family into five smaller ranchos: Santa Gertrudes, Las Bolsas, Los Alamitos, Los Cerritos, and Los Coyotes. Within the next 10 years all had been sold outside the Nieto family. In 1844 Los Cerritos (which contained the project area) was sold to John “Don Juan” Temple, a successful American merchant who came to California and married a Spanish-Californian wife (Cenovich 1995). Temple retained the ranch when California was ceded to the U.S. and continued to manage operations on the property until the drought of the 1860s decimated his herd. He sold the property to an American firm called Flint, Bixby, & Co. in 1866 and Jotham Bixby purchased it from the firm for his family in 1869. The Bixbys initially raised sheep, but in the late 19th century they began to sell parcels to the growing American immigrant population (National Park Service 2018). 4,000 acres were purchased by William E. Willmore, who attempted to develop a farm community named Willmore City. Willmore failed and the land was subsequently purchased by the Long Beach Land and Water Company, who named the community Long Beach.

The City of Long beach was incorporated in 1897 and a modern economy began to take shape. During the early 20th century local commerce was led by resort-based businesses and farming, but by the 1940s the oil industry, Navy facilities, and port dominated the scene (California Department of Conservation 2007). The development of these industries between 1921 and 1936 tripled the Long Beach population and highlighted the need for major infrastructure improvements to the Port of Long Beach and the Port of Los Angeles. Flood control efforts during the 1930s rerouted the Los Angeles River from one-half east to its current location along the project site’s western boundary, enabling development of land previously prone to flooding (Patzert et al. 2014, USGS 1902, USGS 1964). In 1933 a 6.4 earthquake destroyed many of the City’s masonry buildings and disabled local natural gas utilities. The damage prompted Long Beach to adopt stricter construction codes, and the revitalization efforts resulted in many new Art Deco or Streamline Moderne style buildings which remain visible in much of today’s cityscape (City of Long Beach 2010).

More ubiquitous local trends of the 1930s brought housing shortages which, in combination with the Great Depression, prompted the County of Los Angeles to create a housing authority. This new organization was responsible for Southern California's first affordable housing complex in Long Beach, known as the Carmelitos Housing Project. The project was completed in 1939 and included 67 buildings on 50 acres, all of which were inhabited within a year. This initial success led to the development of the Ramona Gardens and Harbor Hills complexes, both completed in 1941. Like many port cities, World War II brought a bustling military industry to Long Beach which caused significant economic boosts, as well as ethnic upheaval. A large Japanese population on Terminal Island was subject to internment during the war and despite the efforts mentioned above, the continuing housing shortage displaced many Greek and Portuguese immigrants. At the same time the African American population of Long Beach expanded considerably as part of the most consequential years of the Great Migration from the rural south. After the war, many veterans moved to Long Beach prompting privately-funded development of new residential neighborhoods as well as corresponding infrastructure and expanded City services. These population pressures served to erase most traces of orchards, dairies, and other agricultural developments from the early part of the century (Ivers 2009). The trends, markedly visible throughout much of California, were decidedly magnified in Long Beach. As the population continued to grow and diversify, civil rights activists and lawmakers teamed up to enact legislation and policies to encourage more fair access to housing and services (Addison 2017). Expansion into the Bixby Knolls and North Long Beach areas followed along with 9.8 square miles of land annexation, most of which was allotted for new subdivisions and residential in-fill throughout the City (City of Long Beach 2010). Expansion included more intensive use and development of municipal City properties evidenced by a master plan for parks, shoreline, and city beautification (adopted in 1954) and by more utilitarian developments such as municipal facilities, including the subject property. Growth slowed during the 1960s and did not resume significantly until the 1980s. By this time new residents from Southeast Asia, Mexico, and Central and Latin America immigrated to Long Beach expanding the population from 361,344 in 1980 to 461,257 in 2010. The accompanying redevelopment again began to reshape the City's appearance and six blocks in downtown were demolished for new construction projects (ibid). Late-century developments include the construction of the Aquarium of the Pacific, and adaptive reuse of many old buildings and structures for commercial and residential purposes that continues today. The local economy has gone from an oil and military emphasis during World War II, diversifying to include aerospace and other industries after the war. In spite of significant reductions, Boeing remains the largest private employer in the City. In the last 20 years, electronics, health care, and entertainment businesses have added to the diversifying economy.

PERSONNEL

David Brunzell, M.A., RPA acted as the Project Manager and Principal Investigator for the current study, conducted the additional research, and compiled the Department of Park and Recreation (DPR) 523 forms and technical report. Staff from the South Central Coastal Information Center (SCCIC) completed the cultural resources records search. BCR Consulting Crew Chief Nicholas Shepetuk, B.A. performed the pedestrian field survey.

METHODS

This work was completed pursuant to CEQA, the Public Resources Code (PRC) Chapter 2.6, Section 21083.2, and California Code of Regulations (CCR) Title 14, Chapter 3, Article 5, Section 15064.5, and to Long Beach Municipal Code Chapter 2.63.060. The pedestrian cultural resources survey was intended to locate and document previously recorded or new cultural resources, including archaeological sites, features, isolates, and historic-period buildings, that exceed 45 years in age within defined project boundaries. The project site was examined using 15-meter transect intervals, where accessible. This study is intended to determine whether cultural resources are located within the project boundaries, whether any cultural resources are significant pursuant to the above-referenced regulations and standards, and to develop specific mitigation measures that will address potential impacts to existing or potential resources. Tasks pursued to achieve that end include:

- Cultural resources records search to review the results of any studies conducted within a one-mile radius of the project boundaries
- Additional research through various local and regional resources
- Systematic pedestrian survey of the entire accessible project site
- California Register and City Landmark eligibility evaluation for resources identified
- Development of recommendations and mitigation measures for cultural resources documented within the project boundaries, following CEQA
- Completion of DPR 523 forms for any discovered cultural resources
- Vertebrate paleontology resources report through the Western Science Center.

Research

Records Search. On May 4, 2021 a records search was conducted by the South Central Coastal Information Center at California State University, Fullerton. This archival research reviewed the status of all recorded historic and prehistoric cultural resources, and survey and excavation reports completed within one half-mile of the current project. Additional resources reviewed included the National Register, the California Register, and documents and inventories published by the California Office of Historic Preservation. These include the lists of California Historical Landmarks, California Points of Historical Interest, Listing of National Register Properties, and the Inventory of Historic Structures.

Additional Research. BCR Consulting performed additional research through records of the General Land Office Maintained by the Bureau of Land Management, the City of Long Beach, the Los Angeles County Assessor, and through various Internet resources.

Field Survey

An intensive-level cultural resources field survey of the project site was conducted on March 18, 2021. The survey was conducted by walking parallel transects spaced approximately 15 meters apart across the accessible project site. Cultural Resources were recorded on DPR 523 forms. Digital photographs were taken at various points within the project site. These included overviews as well as detail photographs of all cultural resources. Cultural resources were recorded per the California OHP *Instructions for Recording Historical Resources* in the field using:

- Detailed note taking for entry on DPR Forms (see Appendix A)

- Hand-held Garmin Global Positioning systems for mapping purposes
- Digital photography of all cultural resources (see Appendix A).

RESULTS

Research

Records Search. Data from the SCCIC revealed that 20 previous cultural resources studies have taken place, and 23 cultural resources (21 historic-period buildings/structures and two prehistoric archaeological sites) have been recorded within one half-mile of the project site. Three previous studies have assessed the project site, and no cultural resources have been previously recorded within its boundaries. The Long Beach Historic Preservation Element was also reviewed during this effort. The records search is summarized in Table A, and a comprehensive bibliography is provided in Appendix D.

Table A. Cultural Resources and Reports Within One Half-Mile of the Project Site

*Previously assessed project site for cultural resources.

Additional Research. Additional research was performed for the project site to provide the background for the building developed during the historic era (i.e. greater than 45 years ago) within its boundaries (see also Field Survey Results, below). Review of the Long Beach Historic Preservation Element did not reveal any City Historic Districts or Designated Structures within or near the project site.

City records indicate that a single warehouse building located on the property at 1401 San Francisco Avenue was built during the historic era, in 1950 (see Brunzell 2018). It was

apparently constructed concurrently with its counterpart, a matching office building fronting 1601 San Francisco Avenue at the adjacent property to the north. Together, both properties and their constituent buildings and structures comprised the Long Beach Public Service Department Yard. Like its counterpart, the warehouse building at the subject property (1401 San Francisco Avenue) was designed by designing engineer Joseph H. Davies, who also designed the Davies Bridge. Its windows were replaced at an unknown date, and building permits indicate that a large front window was covered and a 12 by 14-foot opening for a roll-up door was permitted in 2015 (City of Long Beach 2015). Although none of the subject property's pre-1950 buildings remain in place, it has comprised part of the Long Beach Public Service Department Yard since prior to 1929. Building permits indicate that a municipal garage located on the property was altered in 1929, and a 1600 square foot carpenter shop was constructed on the property in 1932 (City of Long Beach 1929, 1932). In 1959 an electrical control facility that served as a "mechanical brain" to regulate downtown traffic signals was built on the property, and an 85 cubic foot per second storm drain pumping station was on the property until 1968, when it was removed and upgraded at a different location (Long Beach Independent August 7, 1959 and April 18, 1968). These facilities and several other buildings have been constructed and demolished on the subject property over the decades. The only historic-period building that remains in place is the warehouse building fronting 1401 San Francisco Avenue that was built in 1950 (ibid).

Field Survey

During the field survey Nick Shepetuk carefully inspected the accessible project site. The subject property is occupied by a warehouse building with adjoining covered parking (historic in age), and a modern portable wood building. The subject property is surrounded by chain link fencing. Since the modern portable is not historic in age, it does not require further consideration. The historic-period warehouse is a square, flat-roofed concrete building facing San Francisco Avenue in the northern portion of the property. All walls contain windows, the largest of which faces San Francisco Avenue and has been covered. Access is provided through large metal doors on the west and north, and through a double door on the south. The eaves exhibit moderate overhang and a wood-framed covered parking structure adjoins the main building at its north elevation. The unbuilt portions of the property are paved.

SIGNIFICANCE EVALUATIONS

During the field survey, one historic period building was identified. CEQA and the City Municipal Code call for the evaluation and recordation of historic and archaeological resources. The criteria for determining the significance of impacts to cultural resources are based on Section 15064.5 of the *CEQA Guidelines* and Guidelines for the Nomination of Properties to the California Register. Properties eligible for listing in the California Register and subject to review under CEQA are those meeting the criteria for listing in the California Register, or designation under a local ordinance.

Significance Criteria

California Register of Historical Resources. The California Register criteria are based on National Register criteria. City Landmark Designation criteria are similar to California Register criteria; the differences are bracketed [] below. For a property to be eligible for

inclusion on the California Register or as a City Landmark, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local [including City] or regional history, or the cultural heritage of California or the U.S.;
2. It is associated with the lives of persons important to local [the City's], California, or U.S. history;
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

California Register Evaluation

The subject property has comprised part of the Long Beach Public Service Department Yard since the 1920s. The property configuration has been altered and several buildings have been constructed and demolished over the decades. Only the warehouse building constructed in 1950 is extant. Although the warehouse building fits within a context of mid-century modern municipal industrial development, it is not associated with important events related to the founding and/or development of the industry. It is therefore not eligible for the California Register or as a City Landmark under Criterion 1. Criterion 2: Building permits from the City show that J.H. Davies was the Architect/Engineer for the building. Mr. Davies was a local engineer of some note. He was employed as a structural and construction engineer for the City of Long Beach, and was in charge of local emergency relief after the 1933 earthquake. He started the firm J.H. Davies and Associates in 1933 which he operated until his death in 1953 at age 51. The firm had 65 employees in 1953 (Long Beach Independent October 28, 1953 p. 24). Mr. Davies' firm designed many local structures, however he is not recognized as a significant person in the founding or advancement of mid-century modern municipal development, and the subject property does not illustrate any important achievements. Therefore the subject property and its building is not associated with the lives of persons important in California's (or the City's) past. Criterion 3: The building does exhibit limited elements of mid-century industrial design (flat roof and overhanging eaves, large windows, use of industrial materials such as concrete and steel), but is not particularly distinctive. It does not represent the work of an important creative individual or possess high artistic values. Therefore, the subject property and its constituent building is not eligible under Criterion 3. Criterion 4: The subject property has not and is not likely to yield information important in prehistory or history and are therefore not eligible for listing under Criterion 4.

The subject property and its historic-age building are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

Integrity. As the buildings remain in their original positions and are still in an industrial area, they retain integrity of location, setting, and association. Alterations have diminished integrity of design, materials, workmanship, and feeling.

RECOMMENDATIONS

The historic-period building is not recommended eligible for the California Register or as a City Landmark (Long Beach Municipal Code Chapter 2.63.050). As such this resource is not recommended a “historical resource” under CEQA. It does not warrant further consideration. No other cultural resources were identified within the project site boundaries. Furthermore, previous construction-related excavation on the project site and disturbances from the channelizing of the Los Angeles River have disturbed sediments beyond depths at which buried prehistoric cultural resources are likely. Therefore, no significant impacts related to archaeological or historical resources is anticipated and no further investigations are recommended for the proposed project unless:

- the proposed project is changed to include areas not subject to this study;
- cultural materials are encountered during project activities.

Although the current study has not indicated sensitivity for cultural resources within the project boundaries, ground disturbing activities always have the potential to reveal buried deposits not observed on the surface during previous surveys. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist shall have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register, plans for the treatment, evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- historic artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- historic structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- groundstone artifacts, including mortars, pestles, and grinding slabs;
- dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks;

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section

5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

c. Address: 1401 San Francisco Ave City: Long Beach Zip: 90813

d. UTM: Zone: N/A mE/

Elevation: 10' AMSL

e. Other Locational Data: The subject property is located on the west side of San Francisco Ave between West Cowles and 15th Streets. A levy of the channelized portion of the Los Angeles River borders the subject property on the west side.

*P3a. Description: This subject property is occupied by a warehouse building with adjoining covered parking (historic in age), and a modern portable wood building. The subject property is surrounded by chain link fencing. Since the modern portable is not historic in age, it does not require further consideration. The historic-period warehouse is a square, flat-roofed concrete building facing San Francisco Avenue in the northern portion of the property. All walls contain windows, the largest of which faces San Francisco Avenue and has been covered. Access is provided through large metal doors in the west and north walls, and through a double door in the south wall. The eaves provide moderate overhang and a wood-framed covered parking structure adjoins the main building at its north elevation. City records indicate that this building was constructed in 1950. The property was part of the Long Beach Public Service Department Yard (which included 1601 San Francisco Avenue to the north) until recently. The unbuilt portions of the property are paved.

B1. Historic Name: Long Beach Public Service Department Yard B2. Common Name: City Maintenance Yard
B3. Original Use: City Yard B4. Present Use: Vacant

*B5. **Architectural Style:** Midcentury Modern

*B6. **Construction History:** (Construction date, alterations, and date of alterations): City records indicate a build date of 1950 for this historic-period building (see Brunzell 2018). It was apparently constructed concurrently with its counterpart, a matching office building fronting 1601 San Francisco Avenue at the adjacent property to the north. Together, both properties comprised the Public Service Department Yard. Like its counterpart, the building at 1401 San Francisco Avenue was designed by designing engineer Joseph H. Davies, who also designed the Davies Bridge. Windows were replaced at an unknown date and building permits indicate a 12 by 14 foot opening for a roll-up door was permitted in 2015 (City of Long Beach 2015).

California Register of Historical Resources requires that a significance criterion (1-4) be met for a resource to be eligible. City of Long Beach Landmark Designation criteria are similar to the California Register requirements; the differences are indicated in brackets []. A resource is eligible if (1) it is associated with events that have made a significant contribution to the broad patterns of California's [the City's] history and cultural heritage; (2) it is associated with the lives of persons important in California's [the City's] past; (3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (4) it has yielded or is likely to yield information important in prehistory or history. The California Register also requires that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources" (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

The subject property has comprised part of the Long Beach Public Service Department Yard since long before 1950. Building permits indicate that an existing municipal garage located on the property was altered in 1929, and a 1600 square foot carpenter shop was constructed on the property in 1932 (City of Long Beach 1929, 1932). The property contained an electrical control panel that originally served as a "mechanical brain" to regulate downtown traffic signals in 1959, and it housed an 85 cubic foot per second storm drain pumping station which was removed and upgraded at a different location in 1968 (Long Beach Independent August 7, 1959 and April 18, 1968). These facilities and several other buildings have been constructed and demolished over the decades, although the main building fronting 1401 San Francisco Avenue has been in place since 1950 (ibid).

The historic-period building fits within a context of mid-century modern municipal industrial development, however it is not associated with important events related to the founding and/or development of the industry. It is therefore not eligible for the California Register or as a City Landmark under Criterion 1. Criterion 2: Building permits from the City show that J.H. Davies was the Architect/Engineer. Mr. Davies was a local engineer of some note. He was employed as a structural and construction engineer for the City of Long Beach, and was in charge of local emergency relief after the 1933 earthquake. He started the firm J.H. Davies and Associates in 1933 which he operated until his death in 1953 at age 51. The firm had 65 employees in 1953 (Long Beach Independent October 28, 1953 p. 24). Mr. Davies' firm designed many local structures, however he is not recognized as a significant person in the founding or advancement of mid-century modern municipal development, and the subject property does not illustrate any important achievements. Therefore the subject property and its building are not associated with the lives of persons important in California's [or the City's] past. Criterion 3: The building does exhibit limited elements of mid-century industrial design (flat roof and overhanging eaves, large windows, use of industrial materials such as concrete and steel), but is not particularly distinctive from buildings designed after that era. It does not represent the work of an important creative individual or possess high artistic values. Therefore, the subject property and its constituent building are not eligible under Criterion 3. Criterion 4: The subject property has not and is not likely to yield information important in prehistory or history and are therefore not eligible for listing under Criterion 4. The subject property and its historic-age building are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

Integrity. As the building remains in its original positions and the setting remains industrial, it retains integrity of location, setting, and association. Alterations have diminished integrity of design, materials, workmanship, and feeling.

Theme: Mid-Century Modern Municipal Indust. Development **Area:** Long Beach
Period of Significance: 1950s **Property Type:** Municipal/Industrial **Applicable Criteria:** N/A B11. Additional Resource Attributes N/A

APPENDIX B

PALEONTOLOGICAL RESOURCES ASSESSMENT

BCR Consulting LLC
Nicholas Shepetuk
505 West 8th Street
Claremont, CA 91711

March 23, 2021

Dear Mr. Shepetuk,

This letter presents the results of a record search conducted for the 929 West Anaheim Street/1401 San Francisco Avenue Project in the city of Long Beach, Los Angeles County, California. The project site is located at the intersection of Anaheim Street and San Francisco Avenue in an un-sectioned portion of Township 4 South, Range 13 West on the Long Beach, CA USGS 7.5 minute quadrangle.

The geologic units underlying this project are mapped entirely as alluvial deposits dating from the Holocene period (Saucedo et al., 2016). While Holocene alluvial units are considered to be of high preservation value, material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, if development requires any substantial depth of disturbance, the likelihood of reaching Pleistocene alluvial sediments would increase. The Western Science Center does not have localities within the project area or within a 1 mile radius.

While the presence of any fossil material is unlikely, if excavation activity disturbs deeper sediment dating to the earliest parts of the Holocene or Late Pleistocene periods, the material would be scientifically significant. Excavation activity associated with the development of the project area is unlikely to be paleontologically sensitive, but caution during development should be observed.

If you have any questions or would like further information, please feel free to contact me at dradford@westerncentermuseum.org

Sincerely,

A handwritten signature in black ink, appearing to read 'Darla Radford', is positioned above the printed name.

Re: Native American Tribal Consultation, Pursuant to the Assembly Bill 52 (AB 52), Amendments to the California Environmental Quality Act (CEQA) (Chapter 532, Statutes of 2014), Public Resources Code Sections 5097.94 (m), 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2 and 21084.3, 929 West Anaheim Street/1401 San Francisco Avenue Project, Los Angeles County

Dear Mr. Shepetuk:

Pursuant to Public Resources Code section 21080.3.1 (c), attached is a consultation list of tribes that are traditionally and culturally affiliated with the geographic area of the above-listed project. Please note that the intent of the AB 52 amendments to CEQA is to avoid and/or mitigate impacts to tribal cultural resources, (Pub. Resources Code §21084.3 (a)) ("Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.")

Public Resources Code sections 21080.3.1 and 21084.3(c) require CEQA lead agencies to consult with California Native American tribes that have requested notice from such agencies of proposed projects in the geographic area that are traditionally and culturally affiliated with the tribes on projects for which a Notice of Preparation or Notice of Negative Declaration or Mitigated Negative Declaration has been filed on or after July 1, 2015. Specifically, Public Resources Code section 21080.3.1 (d) provides:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.

The AB 52 amendments to CEQA law does not preclude initiating consultation with the tribes that are culturally and traditionally affiliated within your jurisdiction prior to receiving requests for notification of projects in the tribe's areas of traditional and cultural affiliation. The Native American Heritage Commission (NAHC) recommends, but does not require, early consultation as a best practice to ensure that lead agencies receive sufficient information about cultural resources in a project area to avoid damaging effects to tribal cultural resources.

The NAHC also recommends, but does not require that agencies should also include with their notification letters, information regarding any cultural resources assessment that has been completed on the area of potential effect (APE), such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

- A listing of any and all known cultural resources that have already been recorded on or adjacent to the APE, such as known archaeological sites;
- Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
- Whether the records search indicates a low, moderate, or high probability that unrecorded cultural resources are located in the APE; and
- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

- Any report that may contain site forms, site significance, and suggested mitigation measures.

All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code section 6254.10.

3. The result of any Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was negative.

4. Any ethnographic studies conducted for any area including all or part of the APE; and

5. Any geotechnical reports regarding all or part of the APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS are not exhaustive and a negative response to these searches does not preclude the existence of a tribal cultural resource. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the event that they do, having the information beforehand will help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our consultation list remains current.

If you have any questions, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green
Cultural Resources Analyst

RE: **Updated Geotechnical Investigation** for Proposed Industrial Development – Located at the Northwest Corner of Anaheim Street San Francisco Avenue, in the City of Long Beach, California

Dear Mr. Neuhoff:

As per your request, this firm has prepared an updated Geotechnical Investigation for the proposed industrial development at the referenced property. A previous report by Geotechnical Professionals, Inc. (GPI) dated December 20, 2010 was reviewed for the subject site. This firm accepts the recommendations in the GPI report and has provided additional guidelines for site grading.

PROPOSED DEVELOPMENT

It is proposed to construct two new concrete tilt-up warehouse buildings totaling 124,972 square feet on the parcel. Asphaltic and concrete pavement areas and landscaping will also be installed.

RECENT FIELD INVESTIGATION

The recent field investigation by this firm consisted of the placement of three (3) subsurface exploratory borings by hollow-stem rotary wash auger drill rig to a maximum depth of 41.5 feet below current ground elevations. Five borings by hand auger were also placed to a maximum depth of 7.5 feet. The explorations were placed at accessible locations across the site.

The explorations were visually classified and logged by a field engineer with locations of the subsurface explorations shown on the Site Plan, Figure 1. Detailed descriptions of the subsurface conditions are listed on the boring logs in Appendix A.

Groundwater

Groundwater was encountered at 9 to 10 feet below existing grade in our recent borings. Research of the *California Department of Conservation – Division of Mines and Geology Open-File Report 98-19, 1998* indicates that historic high groundwater in the vicinity has been recorded on the order of 10 feet below grade, also.

LABORATORY TESTS

Relatively undisturbed samples of the subsurface soils were obtained to perform laboratory testing and analysis to determine in-place moisture/densities and consolidation tests. These relatively undisturbed ring samples were obtained by driving a thin-walled steel sampler lined with one-inch long brass rings with an inside diameter of 2.42 inches into the undisturbed soils. Blowcount data is given on the Boring Logs in Appendix A.

- a. **Field moisture content** (ASTM:D 2216-10) and the dry density of the ring samples were determined in the laboratory. This data is listed on the logs of explorations.
- b. **Time Rate Consolidation tests** (ASTM: D-2435-11) were performed on undisturbed ring samples to determine the total settlements which may be anticipated based upon the proposed surcharge loads. Plots of the tests, which were performed by GMU are included in Appendix B.

UPDATED SETTLEMENT ESTIMATES

The site is underlain by compressible silt and clay layers primarily in the upper 20 to 25 feet, as shown on Section A-A, Figure 2. Estimated building settlements are one inch due to dead and live loads. Differential settlements would be ¼ inch over a 30 feet (horizontal) distance in the building pad area.

During a local Magnitude 7.0 earthquake with a Peak Ground Acceleration (PGA) of 0.42g, the seismic settlement should be on the order of one inch. Differential settlements after the earthquake would be on the order of ½ inch in 30 feet with the groundwater level at 10 feet deep.

GRADING RECOMMENDATIONS

The proposed buildings should be placed on a compacted fill blanket 5 feet thick beneath the floor slabs and foundations. All current fill materials should be removed prior to placement of the compacted fill blanket. To minimize areal settlements, finish grade should be selected within one foot of existing grade, if possible.

For finish grades greater than one foot above the existing grade, settlements of the upper clay soils would be on the order of $\frac{1}{2}$ to $\frac{3}{4}$ inch for each foot of fill. These settlements should occur over a 3 to 4-month period across the building pad area.

To reduce the building settlement, a surcharge load of 5 to 6 feet of soil may be placed above finish grade. Settlements in the underlying clay soils due to surcharge loads should occur over a 3 to 4-month period, also. The actual ground settlement should be monitored as described in the GPI report.

We appreciate this opportunity to be of service to you. If you have any further questions, please do not hesitate to contact the undersigned.

Respectfully submitted,
NORCAL ENGINEERING

Keith D. Tucker
Project Engineer

HIGHLY ORGANIC SOILS				PT	PEAT, HUMUS, SWAMP SOILS WITH HIGH ORGANIC CONTENTS

NOTE: DUAL SYMBOLS ARE USED TO INDICATE BORDERLINE SOIL CLASSIFICATIONS

UNIFIED SOIL CLASSIFICATION SYSTEM

KEY:

- Indicates 2.5-inch Inside Diameter. Ring Sample.
- ⊠ Indicates 2-inch OD Split Spoon Sample (SPT).
- Indicates Shelby Tube Sample.
- ▤ Indicates No Recovery.
- ▣ Indicates SPT with 140# Hammer 30 in. Drop.
- ☑ Indicates Bulk Sample.
- ▣ Indicates Small Bag Sample.
- ▣ Indicates Non-Standard
- ⊠ Indicates Core Run.

COMPONENT DEFINITIONS

COMPONENT	SIZE RANGE
Boulders	Larger than 12 in
Cobbles	3 in to 12 in
Gravel	3 in to No 4 (4.5mm)
Coarse gravel	3 in to 3/4 in
Fine gravel	3/4 in to No 4 (4.5mm)
Sand	No. 4 (4.5mm) to No. 200 (0.074mm)
Coarse sand	No. 4 (4.5 mm) to No. 10 (2.0 mm)
Medium sand	No. 10 (2.0 mm) to No. 40 (0.42 mm)
Fine sand	No. 40 (0.42 mm) to No. 200 (0.074 mm)
Silt and Clay	Smaller than No. 200 (0.074 mm)

COMPONENT PROPORTIONS

DESCRIPTIVE TERMS	RANGE OF PROPORTION
Trace	1 - 5%
Few	5 - 10%
Little	10 - 20%
Some	20 - 35%
And	35 - 50%

MOISTURE CONTENT

DRY	Absence of moisture, dusty, dry to the touch.
DAMP	Some perceptible moisture; below optimum
MOIST	No visible water; near optimum moisture content
WET	Visible free water, usually soil is below water table.

RELATIVE DENSITY OR CONSISTENCY VERSUS SPT N -VALUE

COHESIONLESS SOILS		COHESIVE SOILS		
Density	N (blows/ft)	Consistency	N (blows/ft)	Approximate Undrained Shear Strength (psf)
Very Loose	0 to 4	Very Soft	0 to 2	< 250
Loose	4 to 10	Soft	2 to 4	250 - 500
Medium Dense	10 to 30	Medium Stiff	4 to 8	500 - 1000
Dense	30 to 50	Stiff	8 to 15	1000 - 2000
Very Dense	over 50	Very Stiff	15 to 30	2000 - 4000
		Hard	over 30	> 4000

EXECUTIVE SUMMARY

Pursuant to California Environmental Quality Act (CEQA) § 15164 (a) the lead agency shall prepare an addendum to a previously certified Environmental Impact Report (EIR) if some changes or additions are necessary but none of the conditions described in §15162 calling for preparation of a subsequent EIR have occurred. More specifically, §15162 (a)(3)(A) states that no subsequent EIR shall be prepared for the project unless the project will have one or more significant effects not discussed in the previous EIR. Significant and unavoidable impacts were previously identified and disclosed for GHG Impact #1 and less than significant impacts were disclosed for GHG Impact #2 in the previously analyzed *Final Recirculated Environmental Impact Report General Plan Land Use and Urban Design Elements SCH No. 2015051054* (referred to herein as *LUE EIR*) (1).

The current greenhouse gas (GHG) study prepared for the proposed Project utilizes the same analysis, methodologies and assumptions (as it relates to Project trip generation methodology) as that assumed and evaluated in the *LUE EIR*. Based on the revised analysis, there will be no additional significant and unavoidable impacts from those previously identified, and therefore a subsequent EIR is not required.

ES.1 SUMMARY OF FINDINGS

The results of this *San Francisco Avenue Greenhouse Gas Analysis* (GHGA) is summarized below based on the significance criteria in Section 3 of this report consistent with Appendix G of the *CEQA (California Environmental Quality Act) Guidelines* (2). Table ES-1 shows the findings of significance for potential GHG impacts under CEQA. The Project is required to comply with the applicable *LUE EIR* Project Design Features and Mitigation Measures (MM). As shown, no MMs beyond those already identified in the *LUE EIR* are required.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Section	Significance Findings			New Significant Impact?
		LUE EIR	Proposed Project		
			Unmitigated	Mitigated	
GHG Impact #1: Would the Project generate GHG emissions either directly or indirectly, that may have a significant impact on the environment?	3.8	Significant and Unavoidable	Less Than Significant	n/a	NO
GHG Impact #2: Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?	3.8	Less Than Significant	Less Than Significant	n/a	NO

ES.2 PROJECT REQUIREMENTS

The Project would be required to comply with regulations imposed by the State of California and the South Coast Air Quality Management District (SCAQMD) aimed at the reduction of air pollutant emissions. Those that are directly and indirectly applicable to the Project and that would assist in the reduction of GHG emissions include:

- Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32) (3).
- Regional GHG Emissions Reduction Targets/Sustainable Communities Strategies (Senate Bill [SB] 375) (4).
- Pavley Fuel Efficiency Standards (AB 1493). Establishes fuel efficiency ratings for new vehicles (5).
- California Building Code (Title 24 California Code of Regulations [CCR]). Establishes energy efficiency requirements for new construction (6).
- Appliance Energy Efficiency Standards (Title 20 CCR). Establishes energy efficiency requirements for appliances (7).
- Low Carbon Fuel Standard (LCFS). Requires carbon content of fuel sold in California to be 10 percent (%) less by 2020 (8).
- California Water Conservation in Landscaping Act of 2006 (AB 1881). Requires local agencies to adopt the Department of Water Resources updated Water Efficient Landscape Ordinance or equivalent by January 1, 2010 to ensure efficient landscapes in new development and reduced water waste in existing landscapes (9).
- Statewide Retail Provider Emissions Performance Standards (SB 1368). Requires energy generators to achieve performance standards for GHG emissions (10).

- Renewable Portfolio Standards (SB 1078 – also referred to as RPS). Requires electric corporations to increase the amount of energy obtained from eligible renewable energy resources to 20% by 2010 and 33% by 2020 (11).
- California Global Warming Solutions Act of 2006 (SB 32). Requires the state to reduce statewide GHG emissions to 40% below 1990 levels by 2030, a reduction target that was first introduced in Executive Order B-30-15 (12).

Promulgated regulations that will affect the Project's emissions are accounted for in the Project's GHG calculations provided in this report. In particular, AB 1493, LCFS, and RPS, and therefore are accounted for in the Project's emission calculations.

This page intentionally left blank

1 INTRODUCTION

This report presents the results of the GHGA prepared by Urban Crossroads, Inc., for the proposed San Francisco Avenue (Project). The purpose of this GHGA is to evaluate Project-related construction and operational emissions and determine the level of GHG impacts as a result of constructing and operating the Project.

1.1 SITE LOCATION

The proposed Project is located on the southwest corner of San Francisco Avenue and Anaheim Street in the City of Long Beach, as shown on Exhibit 1-A. Existing land uses near the site include nearby residences located east and southeast of the Project site. The Los Angeles River is located to the west of the Project site.

1.2 PROJECT DESCRIPTION

The proposed Project is to consist of two warehouse buildings totaling 123,595 square feet (sf) with Building 1 at 62,042 square feet, Building 2 at 61,553 square feet, and an existing 5,827 square foot building (to remain) as shown on Exhibit 1-B. For the purposes of this assessment, the mix of uses for the Project is assumed to consist of 61,797 square feet of warehousing use (no less than 50% warehousing use anticipated) and 61,798 square feet of general light industrial use (remaining 50% of the total square footage). The Project is anticipated to be open by the year 202.

This analysis includes a conservative assumption of on-site Project-related emission sources for potential future tenants, including architectural coatings, consumer products, landscape maintenance equipment, emissions associated with natural gas and electricity, and mobile source emissions. This analysis is intended to describe GHG impacts associated with the expected operational activities at the Project site. This report assumes the Project will operate 24-hours daily for seven days per week.

2 CLIMATE CHANGE SETTING

2.1 INTRODUCTION TO GLOBAL CLIMATE CHANGE (GCC)

GCC is defined as the change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. The majority of scientists believe that the climate shift taking place since the Industrial Revolution is occurring at a quicker rate and magnitude than in the past. Scientific evidence suggests that GCC is the result of increased concentrations of GHGs in the earth's atmosphere, including carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), and fluorinated gases. The majority of scientists believe that this increased rate of climate change is the result of GHGs resulting from human activity and industrialization over the past 200 years.

An individual project like the proposed Project evaluated in this GHGA cannot generate enough GHG emissions to affect a discernible change in global climate. However, the proposed Project may participate in the potential for GCC by its incremental contribution of GHGs combined with the cumulative increase of all other sources of GHGs, which when taken together constitute potential influences on GCC. Because these changes may have serious environmental consequences, Section 3.0 will evaluate the potential for the proposed Project to have a significant effect upon the environment as a result of its potential contribution to the greenhouse effect.

2.2 GLOBAL CLIMATE CHANGE DEFINED

GCC refers to the change in average meteorological conditions on the earth with respect to temperature, wind patterns, precipitation, and storms. Global temperatures are regulated by naturally occurring atmospheric gases such as water vapor, CO₂, N₂O, CH₄, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆). These particular gases are important due to their residence time (duration they stay) in the atmosphere, which ranges from 10 years to more than 100 years. These gases allow solar radiation into the earth's atmosphere, but prevent radioactive heat from escaping, thus warming the earth's atmosphere. GCC can occur naturally as it has in the past with the previous ice ages.

Gases that trap heat in the atmosphere are often referred to as GHGs. GHGs are released into the atmosphere by both natural and anthropogenic activity. Without the natural GHG effect, the earth's average temperature would be approximately 61 degrees Fahrenheit (°F) cooler than it is currently. The cumulative accumulation of these gases in the earth's atmosphere is considered to be the cause for the observed increase in the earth's temperature.

2.3 GHGs

2.3.1 GHGS AND HEALTH EFFECTS

GHGs trap heat in the atmosphere, creating a GHG effect that results in global warming and climate change. Many gases demonstrate these properties and are discussed in Table 2-1. For the purposes of this analysis, emissions of CO₂, CH₄, and N₂O were evaluated (see Table 3-1 later in this report) because these gases are the primary contributors to GCC from development

projects. Although there are other substances such as fluorinated gases that also contribute to GCC, these fluorinated gases were not evaluated as their sources are not well-defined and do not contain accepted emissions factors or methodology to accurately calculate these gases.

TABLE 2-1: GHGS

GHGs	Description	Sources	Health Effects
Water	Water is the most abundant, important, and variable GHG in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered to be a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. A climate feedback is an indirect, or secondary, change, either positive or negative, that occurs within the climate system in response to a forcing mechanism. The feedback loop in which water is involved is critically important to projecting future climate change. As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to 'hold' more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive feedback loop." The extent to which this positive feedback loop will continue is	The main source of water vapor is evaporation from the oceans (approximately 85%). Other sources include evaporation from other water bodies, sublimation (change from solid to gas) from sea ice and snow, and transpiration from plant leaves.	There are no known direct health effects related to water vapor at this time. It should be noted however that when some pollutants react with water vapor, the reaction forms a transport mechanism for some of these pollutants to enter the human body through water vapor.

GHGs	Description	Sources	Health Effects
	unknown as there are also dynamics that hold the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it will eventually condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the earth's surface and heat it up) (13).		
CO ₂	CO ₂ is an odorless and colorless GHG. Since the industrial revolution began in the mid-1700s, the sort of human activity that increases GHG emissions has increased dramatically in scale and distribution. Data from the past 50 years suggests a corollary increase in levels and concentrations. As an example, prior to the industrial revolution, CO ₂ concentrations were fairly stable at 280 parts per million (ppm). Today, they are around 370 ppm, an increase of more than 30%. Left unchecked, the concentration of CO ₂ in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of anthropogenic sources (14).	CO ₂ is emitted from natural and manmade sources. Natural sources include: the decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources include: the burning of coal, oil, natural gas, and wood. CO ₂ is naturally removed from the air by photosynthesis, dissolution into ocean water, transfer to soils and ice caps, and chemical weathering of carbonate rocks (15).	Outdoor levels of CO ₂ are not high enough to result in negative health effects. According to the National Institute for Occupational Safety and Health (NIOSH) high concentrations of CO ₂ can result in health effects such as: headaches, dizziness, restlessness, difficulty breathing, sweating, increased heart rate, increased cardiac output, increased blood pressure, coma, asphyxia, and/or convulsions. It should be noted that current concentrations of CO ₂ in the earth's atmosphere are estimated to be approximately 370 ppm, the actual reference exposure level (level at which adverse health effects typically occur) is at exposure levels of 5,000 ppm averaged over 10 hours in a 40-hour workweek and short-term reference exposure levels of 30,000 ppm averaged over a 15 minute period (16).

GHGs	Description	Sources	Health Effects
CH ₄	CH ₄ is an extremely effective absorber of radiation, although its atmospheric concentration is less than CO ₂ and its lifetime in the atmosphere is brief (10-12 years), compared to other GHGs.	CH ₄ has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of CH ₄ . Other anthropogenic sources include fossil-fuel combustion and biomass burning (17).	CH ₄ is extremely reactive with oxidizers, halogens, and other halogen-containing compounds. Exposure to high levels of CH ₄ can cause asphyxiation, loss of consciousness, headache and dizziness, nausea and vomiting, weakness, loss of coordination, and an increased breathing rate.
N ₂ O	N ₂ O, also known as laughing gas, is a colorless GHG. Concentrations of N ₂ O also began to rise at the beginning of the industrial revolution. In 1998, the global concentration was 314 parts per billion (ppb).	N ₂ O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used as an aerosol spray propellant, i.e., in whipped cream bottles. It is also	N ₂ O can cause dizziness, euphoria, and sometimes slight hallucinations. In small doses, it is considered harmless. However, in some cases, heavy and extended use can cause Olney's Lesions (brain damage) (18).

GHGs	Description	Sources	Health Effects
		used in potato chip bags to keep chips fresh. It is used in rocket engines and in race cars. N ₂ O can be transported into the stratosphere, be deposited on the earth's surface, and be converted to other compounds by chemical reaction (18).	
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in CH ₄ or ethane (C ₂ H ₆) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble and chemically unreactive in the troposphere (the level of air at the earth's surface).	CFCs have no natural source but were first synthesized in 1928. They were used for refrigerants, aerosol propellants and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken and was extremely successful, so much so that levels of the major CFCs are now remaining steady or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years (19).	In confined indoor locations, working with trichlorotrifluoroethane (CFC-113) or other CFCs is thought to result in death by cardiac arrhythmia (heart frequency too high or too low) or asphyxiation.

GHGs	Description	Sources	Health Effects
HFCs	HFCs are synthetic, man-made chemicals that are used as a substitute for CFCs. Out of all the GHGs, they are one of three groups with the highest global warming potential (GWP). The HFCs with the largest measured atmospheric abundances are (in order), Fluoroform (HFC-23), 1,1,1,2-tetrafluoroethane (HFC-134a), and 1,1-difluoroethane (HFC-152a). Prior to 1990, the only significant emissions were of HFC-23. HFC-134a emissions are increasing due to its use as a refrigerant.	HFCs are manmade for applications such as automobile air conditioners and refrigerants.	No health effects are known to result from exposure to HFCs.
PFCs	PFCs have stable molecular structures and do not break down through chemical processes in the lower atmosphere. High-energy ultraviolet rays, which occur about 60 kilometers above earth's surface, are able to destroy the compounds. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF ₄) and hexafluoroethane (C ₂ F ₆). The EPA estimates that concentrations of CF ₄ in the atmosphere are over 70 parts per trillion (ppt).	The two main sources of PFCs are primary aluminum production and semiconductor manufacture.	No health effects are known to result from exposure to PFCs.
SF ₆	SF ₆ is an inorganic, odorless, colorless, nontoxic, nonflammable gas. It also has the highest GWP of any gas evaluated (23,900) (20). The EPA indicates that concentrations in the 1990s were about 4 ppt.	SF ₆ is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.	In high concentrations in confined areas, the gas presents the hazard of suffocation because it displaces the oxygen needed for breathing.

GHGs	Description	Sources	Health Effects
Nitrogen Trifluoride (NF ₃)	NF ₃ is a colorless gas with a distinctly moldy odor. The World Resources Institute (WRI) indicates that NF ₃ has a 100-year GWP of 17,200 (21).	NF ₃ is used in industrial processes and is produced in the manufacturing of semiconductors, Liquid Crystal Display (LCD) panels, types of solar panels, and chemical lasers.	Long-term or repeated exposure may affect the liver and kidneys and may cause fluorosis (22).

The potential health effects related directly to the emissions of CO₂, CH₄, and N₂O as they relate to development projects such as the proposed Project are still being debated in the scientific community. Their cumulative effects to GCC have the potential to cause adverse effects to human health. Increases in Earth's ambient temperatures would result in more intense heat waves, causing more heat-related deaths. Scientists also purport that higher ambient temperatures would increase disease survival rates and result in more widespread disease. Climate change will likely cause shifts in weather patterns, potentially resulting in devastating droughts and food shortages in some areas (23). Exhibit 2-A presents the potential impacts of global warming (24).

EXHIBIT 2-A: SUMMARY OF PROJECTED GLOBAL WARMING IMPACT, 2070-2099 (AS COMPARED WITH 1961-1990)

2.4 GLOBAL WARMING POTENTIAL

GHGs have varying GWP values. GWP of a GHG indicates the amount of warming a gas causes over a given period of time and represents the potential of a gas to trap heat in the atmosphere. CO₂ is utilized as the reference gas for GWP, and thus has a GWP of 1. CO₂ equivalent (CO₂e) is defined as the number of metric tons of CO₂ emissions with the same GWP as one metric ton of another GHG.

The atmospheric lifetime and GWP of selected GHGs are summarized at Table 2-2. As shown in the table below, GWP for the 2nd Assessment Report, the Intergovernmental Panel on Climate Change (IPCC)'s scientific and socio-economic assessment on climate change, range from 1 for CO₂ to 23,900 for SF₆ and GWP for the IPCC's 5th Assessment Report range from 1 for CO₂ to 23,500 for SF₆ (25).

TABLE 2-2: GWP AND ATMOSPHERIC LIFETIME OF SELECT GHGS

Gas	Atmospheric Lifetime (years)	GWP (100-year time horizon)	
		2 nd Assessment Report	5 th Assessment Report
CO ₂	See*	1	1
CH ₄	12 .4	21	28
N ₂ O	121	310	265
HFC-23	222	11,700	12,400
HFC-134a	13.4	1,300	1,300
HFC-152a	1.5	140	138
SF ₆	3,200	23,900	23,500

*As per Appendix 8.A. of IPCC's 5th Assessment Report, no single lifetime can be given.

2.5 GHG EMISSIONS INVENTORIES

2.5.1 GLOBAL

Worldwide anthropogenic GHG emissions are tracked by the IPCC for industrialized nations (referred to as Annex I) and developing nations (referred to as Non-Annex I). Human GHG emissions data for Annex I nations are available through 2018. Based on the latest available data, the sum of these emissions totaled approximately 28,768,439 gigagram (Gg) CO₂e¹ (26) (27) as summarized on Table 2-3.

¹ The global emissions are the sum of Annex I and non-Annex I countries, without counting Land-Use, Land-Use Change and Forestry (LULUCF). For countries without 2018 data, the United Nations' Framework Convention on Climate Change (UNFCCC) data for the most recent year were used U.N. Framework Convention on Climate Change, "Annex I Parties – GHG total without LULUCF," The most recent GHG emissions for China and India are from 2014 and 2010, respectively.

2.5.2 UNITED STATES

As noted in Table 2-3, the United States, as a single country, was the number two producer of GHG emissions in 2018.

TABLE 2-3: TOP GHG PRODUCING COUNTRIES AND THE EUROPEAN UNION ²

Emitting Countries	GHG Emissions (Gg CO₂e)
China	12,300,200
United States	6,676,650
European Union (28-member countries)	4,232,274
Russian Federation	2,220,123
India	2,100,850
Japan	1,238,343
Total	28,768,439

2.5.3 STATE OF CALIFORNIA

California has significantly slowed the rate of growth of GHG emissions due to the implementation of energy efficiency programs as well as adoption of strict emission controls but is still a substantial contributor to the United States (U.S.) emissions inventory total (28). The California Air Resource Board (CARB) compiles GHG inventories for the State of California. Based upon the 2019 GHG inventory data (i.e., the latest year for which data are available) for the 2000-2018 GHG emissions period, California emitted an average 425.3 million metric tons of CO₂e per year (MMTCO₂e/yr) or 425,320 Gg CO₂e (6.37% of the total United States GHG emissions) (29).

2.6 EFFECTS OF CLIMATE CHANGE IN CALIFORNIA

2.6.1 PUBLIC HEALTH

Higher temperatures may increase the frequency, duration, and intensity of conditions conducive to air pollution formation. For example, days with weather conducive to ozone formation could increase from 25 to 35% under the lower warming range to 75 to 85% under the medium warming range. In addition, if global background ozone levels increase as predicted in some scenarios, it may become impossible to meet local air quality standards. Air quality could be further compromised by increases in wildfires, which emit fine particulate matter that can travel long distances, depending on wind conditions. The Climate Scenarios report indicates that large wildfires could become up to 55% more frequent if GHG emissions are not significantly reduced.

In addition, under the higher warming range scenario, there could be up to 100 more days per year with temperatures above 90°F in Los Angeles and 95°F in Sacramento by 2100. This is a large increase over historical patterns and approximately twice the increase projected if temperatures remain within or below the lower warming range. Rising temperatures could increase the risk of

² Used <http://unfccc.int> data for Annex I countries. Consulted the CAIT Climate Data Explorer in <https://www.climatewatchdata.org> site to reference Non-Annex I countries of China and India.

death from dehydration, heat stroke/exhaustion, heart attack, stroke, and respiratory distress caused by extreme heat.

2.6.2 WATER RESOURCES

A vast network of man-made reservoirs and aqueducts captures and transports water throughout the state from northern California rivers and the Colorado River. The current distribution system relies on the Sierra Nevada snowpack to supply water during the dry spring and summer months. Rising temperatures, potentially compounded by decreases in precipitation, could severely reduce spring snowpack, increasing the risk of summer water shortages.

If temperatures continue to increase, more precipitation could fall as rain instead of snow, and the snow that does fall could melt earlier, reducing the Sierra Nevada spring snowpack by as much as 70 to 90%. Under the lower warming range scenario, snowpack losses could be only half as large as those possible if temperatures were to rise to the higher warming range. How much snowpack could be lost depends in part on future precipitation patterns, the projections for which remain uncertain. However, even under the wetter climate projections, the loss of snowpack could pose challenges to water managers and hamper hydropower generation. Winter tourism could be adversely affected, under the lower warming range, the ski season at lower elevations could be reduced by as much as a month. If temperatures reach the higher warming range and precipitation declines, there might be many years with insufficient snow for skiing and snowboarding.

The State's water supplies are also at risk from rising sea levels. An influx of saltwater could degrade California's estuaries, wetlands, and groundwater aquifers. Saltwater intrusion caused by rising sea levels is a major threat to the quality and reliability of water within the southern edge of the Sacramento/San Joaquin River Delta – a major fresh water supply.

2.6.3 AGRICULTURE

Increased temperatures could cause widespread changes to the agriculture industry reducing the quantity and quality of agricultural products statewide. First, California farmers could possibly lose as much as 25% of the water supply needed. Although higher CO₂ levels can stimulate plant production and increase plant water-use efficiency, California's farmers could face greater water demand for crops and a less reliable water supply as temperatures rise. Crop growth and development could change, as could the intensity and frequency of pest and disease outbreaks. Rising temperatures could aggravate ozone pollution, which makes plants more susceptible to disease and pests and interferes with plant growth.

Plant growth tends to be slow at low temperatures, increasing with rising temperatures up to a threshold. However, faster growth can result in less-than-optimal development for many crops, so rising temperatures could worsen the quantity and quality of yield for a number of California's agricultural products. Products likely to be most affected include wine grapes, fruits, and nuts.

In addition, continued GCC could shift the ranges of existing invasive plants and weeds and alter competition patterns with native plants. Range expansion could occur in many species while range contractions may be less likely in rapidly evolving species with significant populations

already established. Should range contractions occur, new or different weed species could fill the emerging gaps. Continued GCC could alter the abundance and types of many pests, lengthen pests' breeding season, and increase pathogen growth rates.

2.6.4 FORESTS AND LANDSCAPES

GCC has the potential to intensify the current threat to forests and landscapes by increasing the risk of wildfire and altering the distribution and character of natural vegetation. If temperatures rise into the medium warming range, the risk of large wildfires in California could increase by as much as 55%, which is almost twice the increase expected if temperatures stay in the lower warming range. However, since wildfire risk is determined by a combination of factors, including precipitation, winds, temperature, and landscape and vegetation conditions, future risks will not be uniform throughout the state. In contrast, wildfires in northern California could increase by up to 90% due to decreased precipitation.

Moreover, continued GCC has the potential to alter natural ecosystems and biological diversity within the state. For example, alpine and subalpine ecosystems could decline by as much as 60 to 80% by the end of the century as a result of increasing temperatures. The productivity of the state's forests has the potential to decrease as a result of GCC.

2.6.5 RISING SEA LEVELS

Rising sea levels, more intense coastal storms, and warmer water temperatures could increasingly threaten the state's coastal regions. Under the higher warming range scenario, sea level is anticipated to rise 22 to 35 inches by 2100. Elevations of this magnitude would inundate low-lying coastal areas with saltwater, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats. Under the lower warming range scenario, sea level could rise 12-14 inches.

2.7 REGULATORY SETTING

2.7.1 INTERNATIONAL

Climate change is a global issue involving GHG emissions from all around the world; therefore, international organizations and countries such as the ones discussed below have made an effort to reduce GHGs.

IPCC

In 1988, the United Nations (U.N.) and the World Meteorological Organization established the IPCC to assess the scientific, technical, and socioeconomic information relevant to understanding the scientific basis of risk of human-induced climate change, its potential impacts, and options for adaptation and mitigation.

UNITED NATION'S FRAMEWORK CONVENTION ON CLIMATE CHANGE (CONVENTION)

On March 21, 1994, the U.S. joined a number of countries around the world in signing the Convention. Under the Convention, governments gather and share information on GHG

emissions, national policies, and best practices; launch national strategies for addressing GHG emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of climate change.

INTERNATIONAL CLIMATE CHANGE TREATIES

The Kyoto Protocol is an international agreement linked to the Convention. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing GHG emissions at an average of 5% against 1990 levels over the five-year period 2008–2012. The Convention (as discussed above) encouraged industrialized countries to stabilize emissions; however, the Protocol commits them to do so. Developed countries have contributed more emissions over the last 150 years; therefore, the Protocol places a heavier burden on developed nations under the principle of “common but differentiated responsibilities.”

In 2001, President George W. Bush indicated that he would not submit the treaty to the U.S. Senate for ratification, which effectively ended American involvement in the Kyoto Protocol. In December 2009, international leaders met in Copenhagen to address the future of international climate change commitments post-Kyoto. No binding agreement was reached in Copenhagen; however, the Committee identified the long-term goal of limiting the maximum global average temperature increase to no more than 2 degrees Celsius (°C) above pre-industrial levels, subject to a review in 2015. The UN Climate Change Committee held additional meetings in Durban, South Africa in November 2011; Doha, Qatar in November 2012; and Warsaw, Poland in November 2013. The meetings are gradually gaining consensus among participants on individual climate change issues.

On September 23, 2014 more than 100 Heads of State and Government and leaders from the private sector and civil society met at the Climate Summit in New York hosted by the U.N. At the Summit, heads of government, business and civil society announced actions in areas that would have the greatest impact on reducing emissions, including climate finance, energy, transport, industry, agriculture, cities, forests, and building resilience.

Parties to the U.N. Framework Convention on Climate Change (UNFCCC) reached a landmark agreement on December 12, 2015 in Paris, charting a fundamentally new course in the two-decade-old global climate effort. Culminating a four-year negotiating round, the new treaty ends the strict differentiation between developed and developing countries that characterized earlier efforts, replacing it with a common framework that commits all countries to put forward their best efforts and to strengthen them in the years ahead. This includes, for the first time, requirements that all parties report regularly on their emissions and implementation efforts and undergo international review.

The agreement and a companion decision by parties were the key outcomes of the conference, known as the 21st session of the UNFCCC Conference of the Parties (COP) 21. Together, the Paris Agreement and the accompanying COP decision:

- Reaffirm the goal of limiting global temperature increase well below 2°C, while urging efforts to limit the increase to 1.5 degrees;
- Establish binding commitments by all parties to make “nationally determined contributions” (NDCs), and to pursue domestic measures aimed at achieving them;
- Commit all countries to report regularly on their emissions and “progress made in implementing and achieving” their NDCs, and to undergo international review;
- Commit all countries to submit new NDCs every five years, with the clear expectation that they will “represent a progression” beyond previous ones;
- Reaffirm the binding obligations of developed countries under the UNFCCC to support the efforts of developing countries, while for the first time encouraging voluntary contributions by developing countries too;
- Extend the current goal of mobilizing \$100 billion a year in support by 2020 through 2025, with a new, higher goal to be set for the period after 2025;
- Extend a mechanism to address “loss and damage” resulting from climate change, which explicitly will not “involve or provide a basis for any liability or compensation;”
- Require parties engaging in international emissions trading to avoid “double counting;” and
- Call for a new mechanism, similar to the Clean Development Mechanism under the Kyoto Protocol, enabling emission reductions in one country to be counted toward another country’s NDC (C2ES 2015a) (30).

On November 4, 2019, the Trump administration formally notified the U.N. that the U.S. would withdraw from the Paris Agreement. It should be noted that withdrawal will be effective one year after notification in 2020.

2.7.2 NATIONAL

Prior to the last decade, there have been no concrete federal regulations of GHGs or major planning for climate change adaptation. The following are actions regarding the federal government, GHGs, and fuel efficiency.

GHG ENDANGERMENT

In *Massachusetts v. Environmental Protection Agency* (EPA) 549 U.S. 497 (2007), decided on April 2, 2007, the U.S. Supreme Court (Supreme Court) found that four GHGs, including CO₂, are air pollutants subject to regulation under Section 202(a)(1) of the Federal Clean Air Act (CAA). The Court held that the EPA Administrator must determine whether emissions of GHGs from new motor vehicles cause or contribute to air pollution, which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. On December 7, 2009, the EPA Administrator signed two distinct findings regarding GHGs under section 202(a) of the CAA:

- Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed GHGs— CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆—in the atmosphere threaten the public health and welfare of current and future generations.

- **Cause or Contribute Finding:** The Administrator finds that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution, which threatens public health and welfare.

These findings do not impose requirements on industry or other entities. However, this was a prerequisite for implementing GHG emissions standards for vehicles, as discussed in the section “Clean Vehicles” below. After a lengthy legal challenge, the Supreme Court declined to review an Appeals Court ruling that upheld the EPA Administrator’s findings (31).

CLEAN VEHICLES

Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light duty trucks. The law has become more stringent over time. On May 19, 2009, President Obama put in motion a new national policy to increase fuel economy for all new cars and trucks sold in the U.S. On April 1, 2010, the EPA and the Department of Transportation’s National Highway Traffic Safety Administration (NHTSA) announced a joint final rule establishing a national program that would reduce GHG emissions and improve fuel economy for new cars and trucks sold in the U.S.

The first phase of the national program applies to passenger cars, light-duty trucks, and medium-duty (MD) passenger vehicles, covering model years 2012 through 2016. They require these vehicles to meet an estimated combined average emissions level of 250 grams of CO₂ per mile, equivalent to 35.5 miles per gallon (mpg) if the automobile industry were to meet this CO₂ level solely through fuel economy improvements. Together, these standards would cut CO₂ emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012–2016). The EPA and the NHTSA issued final rules on a second-phase joint rulemaking establishing national standards for light-duty vehicles for model years 2017 through 2025 in August 2012. The new standards for model years 2017 through 2025 apply to passenger cars, light-duty trucks, and MD passenger vehicles. The final standards are projected to result in an average industry fleetwide level of 163 grams/mile of CO₂ in model year 2025, which is equivalent to 54.5 mpg if achieved exclusively through fuel economy improvements.

The EPA and the U.S. Department of Transportation issued final rules for the first national standards to reduce GHG emissions and improve fuel efficiency of heavy-duty trucks (HDT) and buses on September 15, 2011, effective November 14, 2011. For combination tractors, the agencies are proposing engine and vehicle standards that begin in the 2014 model year and achieve up to a 20% reduction in CO₂ emissions and fuel consumption by the 2018 model year. For HDT and vans, the agencies are proposing separate gasoline and diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10% reduction for gasoline vehicles and a 15% reduction for diesel vehicles by the 2018 model year (12 and 17% respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles, the engine and vehicle standards would achieve up to a 10% reduction in fuel consumption and CO₂ emissions from the 2014 to 2018 model years.

On August 2, 2018, the NHTSA in conjunction with the EPA, released a notice of proposed rulemaking, the *Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks* (SAFE Vehicles Rule). The SAFE Vehicles Rule was proposed to amend existing Corporate Average Fuel Economy (CAFE) and tailpipe CO₂ standards for passenger cars and light trucks and to establish new standards covering model years 2021 through 2026. As of March 31, 2020, the NHTSA and EPA finalized the SAFE Vehicle Rule which increased stringency of CAFE and CO₂ emissions standards by 1.5% each year through model year 2026 (32).

MANDATORY REPORTING OF GHGs

The Consolidated Appropriations Act of 2008, passed in December 2007, requires the establishment of mandatory GHG reporting requirements. On September 22, 2009, the EPA issued the Final Mandatory Reporting of GHGs Rule, which became effective January 1, 2010. The rule requires reporting of GHG emissions from large sources and suppliers in the U.S. and is intended to collect accurate and timely emissions data to inform future policy decisions. Under the rule, suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons per year (MT/yr) or more of GHG emissions are required to submit annual reports to the EPA.

NEW SOURCE REVIEW

The EPA issued a final rule on May 13, 2010, that establishes thresholds for GHGs that define when permits under the New Source Review Prevention of Significant Deterioration and Title V Operating Permit programs are required for new and existing industrial facilities. This final rule “tailors” the requirements of these CAA permitting programs to limit which facilities will be required to obtain Prevention of Significant Deterioration and Title V permits. In the preamble to the revisions to the Federal Code of Regulations, the EPA states:

“This rulemaking is necessary because without it the Prevention of Significant Deterioration and Title V requirements would apply, as of January 2, 2011, at the 100 or 250 tons per year levels provided under the CAA, greatly increasing the number of required permits, imposing undue costs on small sources, overwhelming the resources of permitting authorities, and severely impairing the functioning of the programs. EPA is relieving these resource burdens by phasing in the applicability of these programs to GHG sources, starting with the largest GHG emitters. This rule establishes two initial steps of the phase-in. The rule also commits the agency to take certain actions on future steps addressing smaller sources but excludes certain smaller sources from Prevention of Significant Deterioration and Title V permitting for GHG emissions until at least April 30, 2016.”

The EPA estimates that facilities responsible for nearly 70% of the national GHG emissions from stationary sources will be subject to permitting requirements under this rule. This includes the nation’s largest GHG emitters—power plants, refineries, and cement production facilities.

STANDARDS OF PERFORMANCE FOR GHG EMISSIONS FOR NEW STATIONARY SOURCES: ELECTRIC UTILITY GENERATING UNITS

As required by a settlement agreement, the EPA proposed new performance standards for emissions of CO₂ for new, affected, fossil fuel-fired electric utility generating units on March 27, 2012. New sources greater than 25 megawatts (MW) would be required to meet an output-based standard of 1,000 pounds (lbs) of CO₂ per MW-hour (MWh), based on the performance of widely used natural gas combined cycle technology. It should be noted that on February 9, 2016 the Supreme Court issued a stay of this regulation pending litigation. Additionally, the current EPA Administrator has also signed a measure to repeal the Clean Power Plan, including the CO₂ standards. The Clean Power Plan was officially repealed on June 19, 2019, when the EPA issued the final Affordable Clean Energy rule (ACE). Under ACE, new state emission guidelines were established that provided existing coal-fired electric utility generating units with achievable standards.

CAP-AND-TRADE

Cap-and-trade refers to a policy tool where emissions are limited to a certain amount and can be traded or provides flexibility on how the emitter can comply. Successful examples in the U.S. include the Acid Rain Program and the N₂O Budget Trading Program and Clean Air Interstate Rule in the northeast. There is no federal GHG cap-and-trade program currently; however, some states have joined to create initiatives to provide a mechanism for cap-and-trade.

The Regional GHG Initiative is an effort to reduce GHGs among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont. Each state caps CO₂ emissions from power plants, auctions CO₂ emission allowances, and invests the proceeds in strategic energy programs that further reduce emissions, save consumers money, create jobs, and build a clean energy economy. The Initiative began in 2008 and in 2020 has retained all participating states.

The Western Climate Initiative (WCI) partner jurisdictions have developed a comprehensive initiative to reduce regional GHG emissions to 15% below 2005 levels by 2020. The partners were originally California, British Columbia, Manitoba, Ontario, and Quebec. However, Manitoba and Ontario are not currently participating. California linked with Quebec's cap-and-trade system January 1, 2014, and joint offset auctions took place in 2015. While the WCI has yet to publish whether it has successfully reached the 2020 emissions goal initiative set in 2007, SB 32, requires that California, a major partner in the WCI, adopt the goal of reducing statewide GHG emissions to 40% below the 1990 level by 2030.

SMARTWAY PROGRAM

The SmartWay Program is a public-private initiative between the EPA, large and small trucking companies, rail carriers, logistics companies, commercial manufacturers, retailers, and other federal and state agencies. Its purpose is to improve fuel efficiency and the environmental performance (reduction of both GHG emissions and air pollution) of the goods movement supply chains. SmartWay is comprised of four components (33):

1. SmartWay Transport Partnership: A partnership in which freight carriers and shippers commit to benchmark operations, track fuel consumption, and improve performance annually.
2. SmartWay Technology Program: A testing, verification, and designation program to help freight companies identify equipment, technologies, and strategies that save fuel and lower emissions.
3. SmartWay Vehicles: A program that ranks light-duty cars and small trucks and identifies superior environmental performers with the SmartWay logo.
4. SmartWay International Interests: Guidance and resources for countries seeking to develop freight sustainability programs modeled after SmartWay.

SmartWay effectively refers to requirements geared towards reducing fuel consumption. Most large trucking fleets driving newer vehicles are compliant with SmartWay design requirements. Moreover, over time, all HDTs will have to comply with CARB GHG Regulation that is designed with the SmartWay Program in mind, to reduce GHG emissions by making them more fuel-efficient. For instance, in 2015, 53 foot or longer dry vans or refrigerated trailers equipped with a combination of SmartWay-verified low-rolling resistance tires and SmartWay-verified aerodynamic devices would obtain a total of 10% or more fuel savings over traditional trailers.

Through the SmartWay Technology Program, the EPA has evaluated the fuel saving benefits of various devices through grants, cooperative agreements, emissions and fuel economy testing, demonstration projects and technical literature review. As a result, the EPA has determined the following types of technologies provide fuel saving and/or emission reducing benefits when used properly in their designed applications, and has verified certain products:

- Idle reduction technologies – less idling of the engine when it is not needed would reduce fuel consumption.
- Aerodynamic technologies minimize drag and improve airflow over the entire tractor-trailer vehicle. Aerodynamic technologies include gap fairings that reduce turbulence between the tractor and trailer, side skirts that minimize wind under the trailer, and rear fairings that reduce turbulence and pressure drop at the rear of the trailer.
- Low rolling resistance tires can roll longer without slowing down, thereby reducing the amount of fuel used. Rolling resistance (or rolling friction or rolling drag) is the force resisting the motion when a tire rolls on a surface. The wheel will eventually slow down because of this resistance.
- Retrofit technologies include things such as diesel particulate filters, emissions upgrades (to a higher tier), etc., which would reduce emissions.
- Federal excise tax exemptions.

2.7.3 CALIFORNIA

2.7.3.1 LEGISLATIVE ACTIONS TO REDUCE GHGS

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation such as the landmark AB 32 was specifically enacted to address GHG emissions. Other legislation such as Title 24 and Title 20 energy standards were originally adopted for other purposes such as energy and water

conservation, but also provide GHG reductions. This section describes the major provisions of the legislation.

EXECUTIVE ORDER S-3-05

Former California Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05, the following reduction targets for GHG emissions:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80% below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

AB 32

The California State Legislature enacted AB 32, which requires that GHGs emitted in California be reduced to 1990 levels by the year 2020. “GHGs” as defined under AB 32 include CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆. Since AB 32 was enacted, a seventh chemical, nitrogen trifluoride, has also been added to the list of GHGs. CARB is the state agency charged with monitoring and regulating sources of GHGs. Pursuant to AB 32, CARB adopted regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions. AB 32 states the following:

“Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems.”

CARB approved the 1990 GHG emissions level of 427 MMTCO₂e on December 6, 2007 (34). Therefore, emissions generated in California in 2020 are required to be equal to or less than 427 MMTCO₂e. Emissions in 2020 in a “business as usual” (BAU) scenario were estimated to be 596 MMTCO₂e, which do not account for reductions from AB 32 regulations (35). At that level, a 28.4% reduction was required to achieve the 427 MMTCO₂e 1990 inventory. In October 2010, CARB prepared an updated BAU 2020 forecast to account for the recession and slower forecasted growth. The forecasted inventory without the benefits of adopted regulation is now estimated at 545 MMTCO₂e. Therefore, under the updated forecast, a 21.7% reduction from BAU is required to achieve 1990 levels (36).

PROGRESS IN ACHIEVING AB 32 TARGETS AND REMAINING REDUCTIONS REQUIRED

The State has made steady progress in implementing AB 32 and achieving targets included in Executive Order S-3-05. The progress is shown in updated emission inventories prepared by CARB for 2000 through 2012 (37). The State has achieved the Executive Order S-3-05 target for 2010 of reducing GHG emissions to 2000 levels. As shown below, the 2010 emission inventory achieved this target.

- 1990: 427 MMTCO₂e (AB 32 2020 target)
- 2000: 463 MMTCO₂e (an average 8% reduction needed to achieve 1990 base)
- 2010: 450 MMTCO₂e (an average 5% reduction needed to achieve 1990 base)

CARB has also made substantial progress in achieving its goal of achieving 1990 emissions levels by 2020. As described earlier in this section, CARB revised the 2020 BAU inventory forecast to account for new lower growth projections, which resulted in a new lower reduction from BAU to achieve the 1990 base. The previous reduction from 2020 BAU needed to achieve 1990 levels was 28.4% and the latest reduction from 2020 BAU is 21.7%.

- 2020: 545 MMTCO₂e BAU (an average 21.7% reduction from BAU needed to achieve 1990 base)

SB 375 – THE SUSTAINABLE COMMUNITIES AND CLIMATE PROTECTION ACT OF 2008

Passing the Senate on August 30, 2008, Senate Bill (SB) 375 was signed by the Governor on September 30, 2008. According to SB 375, the transportation sector is the largest contributor of GHG emissions, which emits over 40% of the total GHG emissions in California. SB 375 states, “Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32.” SB 375 does the following: it (1) requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, (2) aligns planning for transportation and housing, and (3) creates specified incentives for the implementation of the strategies.

SB 375 also requires Metropolitan Planning Organizations (MPOs) to prepare a Sustainable Communities Strategy (SCS) within the Regional Transportation Plan (RTP) that guides growth while taking into account the transportation, housing, environmental, and economic needs of the region. SB 375 uses CEQA streamlining as an incentive to encourage residential projects, which help achieve AB 32 goals to reduce GHG emissions. Although SB 375 does not prevent CARB from adopting additional regulations, such actions are not anticipated in the foreseeable future.

Concerning CEQA, SB 375, as codified in Public Resources Code Section 21159.28, states that CEQA findings for certain projects are not required to reference, describe, or discuss (1) growth inducing impacts, or (2) any project-specific or cumulative impacts from cars and light-duty truck trips generated by the project on global warming or the regional transportation network, if the project:

1. Is in an area with an approved sustainable communities strategy or an alternative planning strategy that CARB accepts as achieving the GHG emission reduction targets.
2. Is consistent with that strategy (in designation, density, building intensity, and applicable policies).

3. Incorporates the mitigation measures required by an applicable prior environmental document.

AB 1493

California AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the U.S. District Court for the District of Columbia in 2011.

The second phase of the implementation for the Pavley bill is currently in effect and was incorporated into Amendments to the Low-Emission Vehicle Program (LEV III) or the Advanced Clean Cars program. The Advanced Clean Car program combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of requirements for model years 2017 through 2025. The regulation will reduce GHGs from new cars by 34% from 2016 levels by 2025. The new rules will clean up gasoline and diesel-powered cars, and deliver increasing numbers of zero-emission technologies, such as full battery electric cars, newly emerging plug-in hybrid electric vehicles (EV) and hydrogen fuel cell cars. The package will also ensure adequate fueling infrastructure is available for the increasing numbers of hydrogen fuel cell vehicles planned for deployment in California.

SB 350— CLEAN ENERGY AND POLLUTION REDUCTION ACT OF 2015

In October 2015, the legislature approved, and the Governor signed, SB 350, which reaffirms California's commitment to reducing its GHG emissions and addressing climate change. Key provisions include an increase in the RPS, higher energy efficiency requirements for buildings, initial strategies towards a regional electricity grid, and improved infrastructure for EV charging stations. Provisions for a 50% reduction in the use of petroleum statewide were removed from the Bill because of opposition and concern that it would prevent the Bill's passage. Specifically, SB 350 requires the following to reduce statewide GHG emissions:

- Increase the amount of electricity procured from renewable energy sources from 33% to 50% by 2030, with interim targets of 40% by 2024, and 25% by 2027.
- Double the energy efficiency in existing buildings by 2030. This target will be achieved through the California Public Utility Commission (CPUC), the California Energy Commission (CEC), and local publicly owned utilities.
- Reorganize the Independent System Operator to develop more regional electrify transmission markets and to improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

SB 32

On September 8, 2016, Governor Jerry Brown signed the Senate Bill (SB) 32 and its companion bill, AB 197. SB 32 requires the state to reduce statewide GHG emissions to 40% below 1990 levels by 2030, a reduction target that was first introduced in Executive Order B-30-15. The new legislation builds upon the AB 32 goal of 1990 levels by 2020 and provides an intermediate goal to achieving S-3-05, which sets a statewide GHG reduction target of 80% below 1990 levels by

2050. AB 197 creates a legislative committee to oversee regulators to ensure that CARB not only responds to the Governor, but also the Legislature (12).

CARB SCOPING PLAN

CARB's Climate Change Scoping Plan (Scoping Plan) contains measures designed to reduce the State's emissions to 1990 levels by the year 2020 to comply with AB 32 (35). The Scoping Plan identifies recommended measures for multiple GHG emission sectors and the associated emission reductions needed to achieve the year 2020 emissions target—each sector has a different emission reduction target. Most of the measures target the transportation and electricity sectors. As stated in the Scoping Plan, the key elements of the strategy for achieving the 2020 GHG target include:

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
- Achieving a statewide renewables energy mix of 33%;
- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system;
- Establishing targets for transportation related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets;
- Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, goods movement measures, and the LCFS; and
- Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State's long-term commitment to AB 32 implementation.

CARB approved the First Scoping Plan Update on May 22, 2014. The First Scoping Plan Update identifies the next steps for California's climate change strategy. The First Scoping Plan Update shows how California continues on its path to meet the near-term 2020 GHG limit, but also sets a path toward long-term, deep GHG emission reductions. The report establishes a broad framework for continued emission reductions beyond 2020, on the path to 80% below 1990 levels by 2050. The First Scoping Plan Update identifies progress made to meet the near-term objectives of AB 32 and defines California's climate change priorities and activities for the next several years. The First Scoping Plan Update does not set new targets for the State but describes a path that would achieve the long term 2050 goal of Executive Order S-3-05 for emissions to decline to 80% below 1990 levels by 2050 (37).

Forecasting the amount of emissions that would occur in 2020 if no actions are taken was necessary to assess the amount of reductions California must achieve to return to the 1990 emissions level by 2020 as required by AB 32. The no-action scenario is known as "business-as-usual" or BAU. CARB originally defined the BAU scenario as emissions in the absence of any GHG emission reduction measures discussed in the Scoping Plan.

As part of CEQA compliance for the Scoping Plan, CARB prepared a Supplemental Functional Equivalent Document (FED) in 2011. The FED included an updated 2020 BAU emissions inventory projection based on current economic forecasts (i.e., as influenced by the economic downturn)

and emission reduction measures already in place, replacing its prior 2020 BAU emissions inventory. CARB staff derived the updated emissions estimates by projecting emissions growth, by sector, from the state's average emissions from 2006–2008. The new BAU estimate includes emission reductions for the million-solar-roofs program, the AB 1493 motor vehicle GHG emission standards, and the LCFS. In addition, CARB factored into the 2020 BAU inventory emissions reductions associated with 33% RPS for electricity generation. The updated BAU estimate of 507 MMTCO₂e by 2020 requires a reduction of 80 MMTCO₂e, or a 16% reduction below the estimated BAU levels to return to 1990 levels (i.e., 427 MMTCO₂e) by 2020.

In order to provide a BAU reduction that is consistent with the original definition in the Scoping Plan and with threshold definitions used in thresholds adopted by lead agencies for CEQA purposes and many climate action plans (CAPs), the updated inventory without regulations was also included in the Supplemental FED. CARB 2020 BAU projection for GHG emissions in California was originally estimated to be 596 MMTCO₂e. The updated CARB 2020 BAU projection in the Supplemental FED is 545 MMTCO₂e. Considering the updated BAU estimate of 545 MMTCO₂e by 2020, CARB estimates a 21.7% reduction below the estimated statewide BAU levels is necessary to return to 1990 emission levels (i.e., 427 MMTCO₂e) by 2020, instead of the approximate 28.4% BAU reduction previously reported under the original Climate Change Scoping Plan (35).

2017 CLIMATE CHANGE SCOPING PLAN UPDATE

In compliance with AB 32 and the 2008 Scoping Plan, the target year 2020 has been fulfilled and will look onward to the 2017 Scoping Plan that should be in compliance by 2030.

In November 2017, CARB released the 2017 Scoping Plan Update, which identifies the State's post-2020 reduction strategy. The 2017 Scoping Plan Update reflects the 2030 target of a 40% reduction below 1990 levels, set by Executive Order B-30-15 and codified by SB 32. Key programs that the proposed Second Update builds upon include the Cap-and-Trade Regulation, the LCFS, and much cleaner cars, trucks, and freight movement, utilizing cleaner, renewable energy, and strategies to reduce CH₄ emissions from agricultural and other wastes.

The 2017 Scoping Plan Update establishes a new emissions limit of 260 MMTCO₂e for the year 2030, which corresponds to a 40% decrease in 1990 levels by 2030.

California's climate strategy will require contributions from all sectors of the economy, including the land base, and will include enhanced focus on zero- and near-zero-emission (ZE/NZE) vehicle technologies; continued investment in renewables, including solar roofs, wind, and other distributed generation; greater use of low carbon fuels; integrated land conservation and development strategies; coordinated efforts to reduce emissions of short-lived climate pollutants (CH₄, black carbon, and fluorinated gases); and an increased focus on integrated land use planning to support livable, transit-connected communities and conservation of agricultural and other lands. Requirements for direct GHG reductions at refineries will further support air quality co-benefits in neighborhoods, including in disadvantaged communities historically located adjacent to these large stationary sources, as well as efforts with California's local air pollution

control and air quality management districts (air districts) to tighten emission limits on a broad spectrum of industrial sources. Major elements of the 2017 Scoping Plan framework include:

- Implementing and/or increasing the standards of the Mobile Source Strategy, which include increasing ZEV buses and trucks.
- LCFS, with an increased stringency (18% by 2030).
- Implementing SB 350, which expands the RPS to 50% RPS and doubles energy efficiency savings by 2030.
- California Sustainable Freight Action Plan, which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of zero-emission vehicles (ZEV) trucks.
- Implementing the proposed Short-Lived Climate Pollutant Strategy (SLPS), which focuses on reducing CH₄ and hydrofluorocarbon emissions by 40% and anthropogenic black carbon emissions by 50% by year 2030.
- Continued implementation of SB 375.
- Post-2020 Cap-and-Trade Program that includes declining caps.
- 20% reduction in GHG emissions from refineries by 2030.
- Development of a Natural and Working Lands Action Plan to secure California's land base as a net carbon sink.

Note, however, that the 2017 Scoping Plan acknowledges that:

"[a]chieving net zero increases in GHG emissions, resulting in no contribution to GHG impacts, may not be feasible or appropriate for every project, however, and the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA."

In addition to the statewide strategies listed above, the 2017 Scoping Plan Update also identifies local governments as essential partners in achieving the State's long-term GHG reduction goals and identifies local actions to reduce GHG emissions. As part of the recommended actions, CARB recommends that local governments achieve a community-wide goal to achieve emissions of no more than 6 metric tons of CO₂e (MTCO₂e) or less per capita by 2030 and 2 MTCO₂e or less per capita by 2050. For CEQA projects, CARB states that lead agencies may develop evidenced-based bright-line numeric thresholds—consistent with the Scoping Plan and the State's long-term GHG goals—and projects with emissions over that amount may be required to incorporate on-site design features and mitigation measures that avoid or minimize project emissions to the degree feasible; or a performance-based metric using a CAP or other plan to reduce GHG emissions is appropriate.

According to research conducted by the Lawrence Berkeley National Laboratory (LBNL) and supported by CARB, California, under its existing and proposed GHG reduction policies, is on track to meet the 2020 reduction targets under AB 32 and could achieve the 2030 goals under SB 32. The research utilized a new, validated model known as the California LBNL GHG Analysis of Policies Spreadsheet (CALGAPS), which simulates GHG and criteria pollutant emissions in California from 2010 to 2050 in accordance to existing and future GHG-reducing policies. The

CALGAPS model showed that GHG emissions through 2020 could range from 317 to 415 MTCO₂e per year (MTCO₂e/yr), “indicating that existing state policies will likely allow California to meet its target [of 2020 levels under AB 32].” CALGAPS also showed that by 2030, emissions could range from 211 to 428 MTCO₂e/yr, indicating that “even if all modeled policies are not implemented, reductions could be sufficient to reduce emissions 40% below the 1990 level [of SB 32].” CALGAPS analyzed emissions through 2050 even though it did not generally account for policies that might be put in place after 2030. Although the research indicated that the emissions would not meet the State’s 80% reduction goal by 2050, various combinations of policies could allow California’s cumulative emissions to remain very low through 2050 (38) (39).

CAP-AND-TRADE PROGRAM

The Scoping Plan identifies a Cap-and-Trade Program as one of the key strategies for California to reduce GHG emissions. According to CARB, a cap-and-trade program will help put California on the path to meet its goal of reducing GHG emissions to 1990 levels by the year 2020 and ultimately achieving an 80% reduction from 1990 levels by 2050. Under cap-and-trade, an overall limit on GHG emissions from capped sectors is established, and facilities subject to the cap will be able to trade permits to emit GHGs within the overall limit.

CARB adopted a California Cap-and-Trade Program pursuant to its authority under AB 32. See Title 17 of the CCR §§ 95800 to 96023). The Cap-and-Trade Program is designed to reduce GHG emissions from major sources (deemed “covered entities”) by setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve AB 32’s emission-reduction mandate of returning to 1990 levels of emissions by 2020. The statewide cap for GHG emissions from the capped sectors (e.g., electricity generation, petroleum refining, and cement production) commenced in 2013 and will decline over time, achieving GHG emission reductions throughout the program’s duration.

Covered entities that emit more than 25,000 MTCO₂e/yr must comply with the Cap-and-Trade Program. Triggering of the 25,000 MTCO₂e/yr “inclusion threshold” is measured against a subset of emissions reported and verified under the California Regulation for the Mandatory Reporting of GHG Emissions (Mandatory Reporting Rule or “MRR”).

Under the Cap-and-Trade Program, CARB issues allowances equal to the total amount of allowable emissions over a given compliance period and distributes these to regulated entities. Covered entities are allocated free allowances in whole or part (if eligible), and may buy allowances at auction, purchase allowances from others, or purchase offset credits. Each covered entity with a compliance obligation is required to surrender “compliance instruments” (30) for each MTCO₂e of GHG they emit. There also are requirements to surrender compliance instruments covering 30% of the prior year’s compliance obligation by November of each year. For example, in November 2014, a covered entity was required to submit compliance instruments to cover 30% of its 2013 GHG emissions.

The Cap-and-Trade Program provides a firm cap, ensuring that the 2020 statewide emission limit will not be exceeded. An inherent feature of the Cap-and-Trade program is that it does not guarantee GHG emissions reductions in any discrete location or by any particular source. Rather,

GHG emissions reductions are only guaranteed on an accumulative basis. As summarized by CARB in the First Update:

“The Cap-and-Trade Regulation gives companies the flexibility to trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more have to turn in more allowances or other compliance instruments. Companies that can cut their GHG emissions have to turn in fewer allowances. But as the cap declines, aggregate emissions must be reduced. In other words, a covered entity theoretically could increase its GHG emissions every year and still comply with the Cap-and-Trade Program if there is a reduction in GHG emissions from other covered entities. Such a focus on aggregate GHG emissions is considered appropriate because climate change is a global phenomenon, and the effects of GHG emissions are considered cumulative (CARB 2014).”

The Cap-and-Trade Program works with other direct regulatory measures and provides an economic incentive to reduce emissions. If California’s direct regulatory measures reduce GHG emissions more than expected, then the Cap-and-Trade Program will be responsible for relatively fewer emissions reductions. If California’s direct regulatory measures reduce GHG emissions less than expected, then the Cap-and-Trade Program will be responsible for relatively more emissions reductions. Thus, the Cap-and-Trade Program assures that California will meet its 2020 GHG emissions reduction mandate:

“The Cap-and-Trade Program establishes an overall limit on GHG emissions from most of the California economy—the “capped sectors.” Within the capped sectors, some of the reductions are being accomplished through direct regulations, such as improved building and appliance efficiency standards, the [Low Carbon Fuel Standard] LCFS, and the 33% [Renewables Portfolio Standard] RPS. Whatever additional reductions are needed to bring emissions within the cap is accomplished through price incentives posed by emissions allowance prices. Together, direct regulation and price incentives assure that emissions are brought down cost-effectively to the level of the overall cap. The Cap-and-Trade Regulation provides assurance that California’s 2020 limit will be met because the regulation sets a firm limit on 85% of California’s GHG emissions. In sum, the Cap-and-Trade Program will achieve aggregate, rather than site specific or project-level, GHG emissions reductions. Also, due to the regulatory architecture adopted by CARB in AB 32, the reductions attributed to the Cap-and-Trade Program can change over time depending on the State’s emissions forecasts and the effectiveness of direct regulatory measures (37).”

As of January 1, 2015, the Cap-and-Trade Program covered approximately 85% of California’s GHG emissions. The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, whether generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects’ electricity usage are covered by the Cap-and-Trade Program.

The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and from combustion of other fossil fuels not directly covered at large sources in the Program’s first compliance period. While the Cap-and-Trade Program technically covered fuel suppliers as early as 2012, they did not have a compliance obligation (i.e., they were not fully regulated) until 2015. The Cap-and-Trade Program covers the GHG emissions associated with the combustion of transportation fuels in California, whether refined in-state or imported. The point of regulation for transportation fuels is when they are “supplied” (i.e., delivered into commerce). Accordingly, as with stationary source GHG emissions and GHG emissions attributable to electricity use, virtually all, if not all, of GHG emissions from CEQA projects associated with VMT are covered by the Cap-and-Trade Program (40). In addition, the Scoping Plan differentiates between “capped” and “uncapped” strategies. “Capped” strategies are subject to the proposed cap-and-trade program. The Scoping Plan states that the inclusion of these emissions within the Program will help ensure that the year 2020 emission targets are met despite some degree of uncertainty in the emission reduction estimates for any individual measure. Implementation of the capped strategies is calculated to achieve a sufficient amount of reductions by 2020 to achieve the emission target contained in AB 32. “Uncapped” strategies that will not be subject to the cap-and-trade emissions caps and requirements are provided as a margin of safety by accounting for additional GHG emission reductions.³

2.7.3.2 EXECUTIVE ORDERS RELATED TO GHG EMISSIONS

California’s Executive Branch has taken several actions to reduce GHGs through the use of Executive Orders. Although not regulatory, they set the tone for the state and guide the actions of state agencies.

EXECUTIVE ORDER S-13-08

Executive Order S-13-08 states that “climate change in California during the next century is expected to shift precipitation patterns, accelerate sea level rise and increase temperatures, thereby posing a serious threat to California’s economy, to the health and welfare of its population and to its natural resources.” Pursuant to the requirements in the Order, the 2009 California Climate Adaptation Strategy (CNRA 2009) was adopted, which is the “...first statewide, multi-sector, region-specific, and information-based climate change adaptation strategy in the United States.” Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

³ On March 17, 2011, the San Francisco Superior Court issued a final decision in *Association of Irrigated Residents v. California Air Resources Board* (Case No. CPF-09-509562). While the Court upheld the validity of CARB Scoping Plan for the implementation of AB 32, the Court enjoined CARB from further rulemaking under AB 32 until CARB amends its CEQA environmental review of the Scoping Plan to address the flaws identified by the Court. On May 23, 2011, CARB filed an appeal. On June 24, 2011, the Court of Appeal granted CARB’s petition staying the trial court’s order pending consideration of the appeal. In the interest of informed decision-making, on June 13, 2011, CARB released the expanded alternatives analysis in a draft Supplement to the AB 32 Scoping Plan Functional Equivalent Document. CARB Board approved the Scoping Plan and the CEQA document on August 24, 2011.

EXECUTIVE ORDER B-30-15

On April 29, 2015, Governor Edmund G. Brown Jr. issued an executive order to establish a California GHG reduction target of 40% below 1990 levels by 2030. The Governor's executive order aligns California's GHG reduction targets with those of leading international governments ahead of the United Nations Climate Change Conference in Paris late 2015. The Order sets a new interim statewide GHG emission reduction target to reduce GHG emissions to 40% below 1990 levels by 2030 in order to ensure California meets its target of reducing GHG emissions to 80% below 1990 levels by 2050 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of MMTCO₂e. The Order also requires the state's climate adaptation plan to be updated every three years, and for the State to continue its climate change research program, among other provisions. As with Executive Order S-3-05, this Order is not legally enforceable for local governments and the private sector. Legislation that would update AB 32 to make post 2020 targets and requirements a mandate is in process in the State Legislature.

EXECUTIVE ORDER S-01-07 – LCFS

The Governor signed Executive Order S-01-07 on January 18, 2007. The order mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10% by 2020. In particular, the Executive Order established a LCFS and directed the Secretary for Environmental Protection to coordinate the actions of the CEC, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. This analysis supporting development of the protocols was included in the State Implementation Plan for alternative fuels (State Alternative Fuels Plan adopted by CEC on December 24, 2007) and was submitted to CARB for consideration as an "early action" item under AB 32. CARB adopted the LCFS on April 23, 2009.

The Board approved the LCFS regulation in 2009 and began implementation on January 1, 2011. CARB approved some amendments to the LCFS in December 2011, which were implemented on January 1, 2013. In September 2015, the Board approved the re-adoption of the LCFS, which became effective on January 1, 2016, to address procedural deficiencies in the way the original regulation was adopted. In 2018, the Board approved amendments to the regulation, which included strengthening and smoothing the carbon intensity benchmarks through 2030 in-line with California's 2030 GHG emission reduction target enacted through SB 32, adding new crediting opportunities to promote zero emission vehicle adoption, alternative jet fuel, carbon capture and sequestration, and advanced technologies to achieve deep decarbonization in the transportation sector.

EXECUTIVE ORDER B-55-18 AND SB 100

Executive Order B-55-18 and SB 100. SB 100 and Executive Order B-55-18 were signed by Governor Brown on September 10, 2018. Under the existing RPS, 25% of retail sales are required to be from renewable sources by December 31, 2016, 33% by December 31, 2020, 40% by December 31, 2024, 45% by December 31, 2027, and 50% by December 31, 2030. SB 100 raises California's RPS requirement to 50% renewable resources target by December 31, 2026, and to

achieve a 60% target by December 31, 2030. SB 100 also requires that retail sellers and local publicly owned electric utilities procure a minimum quantity of electricity products from eligible renewable energy resources so that the total kilowatt hours of those products sold to their retail end-use customers achieve 44% of retail sales by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030. In addition to targets under AB 32 and SB 32, Executive Order B-55-18 establishes a carbon neutrality goal for the state of California by 2045; and sets a goal to maintain net negative emissions thereafter. The Executive Order directs the California Natural Resources Agency (CNRA), California Environmental Protection Agency (CalEPA), the Department of Food and Agriculture (CDFA), and CARB to include sequestration targets in the Natural and Working Lands Climate Change Implementation Plan consistent with the carbon neutrality goal.

2.7.3.3 CALIFORNIA REGULATIONS AND BUILDING CODES

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

TITLE 20 CCR

CCR, Title 20: Division 2, Chapter 4, Article 4, Sections 1601-1608: Appliance Efficiency Regulations regulates the sale of appliances in California. The Appliance Efficiency Regulations include standards for both federally regulated appliances and non-federally regulated appliances. Twenty-three categories of appliances are included in the scope of these regulations. The standards within these regulations apply to appliances that are sold or offered for sale in California, except those sold wholesale in California for final retail sale outside the state and those designed and sold exclusively for use in recreational vehicles or other mobile equipment (CEC 2012).

TITLE 24 CCR

CCR Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. CCR, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on January 1, 2009, and is administered by the California Building Standards Commission.

CALGreen is updated on a regular basis, with the most recent approved update consisting of the 2019 California Green Building Code Standards that became effective January 1, 2020.

Local jurisdictions are permitted to adopt more stringent requirements, as state law provides methods for local enhancements. CALGreen recognizes that many jurisdictions have developed existing construction waste and demolition ordinances and defers to them as the ruling guidance provided they establish a minimum 65% diversion requirement.

The code also provides exemptions for areas not served by construction waste and demolition recycling infrastructure. The State Building Code provides the minimum standard that buildings must meet in order to be certified for occupancy, which is generally enforced by the local building official.

Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The 2019 version of Title 24 was adopted by the California Energy Commission (CEC) and became effective on January 1, 2020.

The 2019 Title 24 standards will result in less energy use, thereby reducing GHG emissions associated with energy consumption in the South Coast Air Basin (SCAB) and across the State of California. For example, the 2019 Title 24 standards will require solar photovoltaic systems for new homes, establish requirements for newly constructed healthcare facilities, encourage demand responsive technologies for residential buildings, and update indoor and outdoor lighting requirements for nonresidential buildings.

The CEC anticipates that single-family homes built with the 2019 standards will use approximately 7% less energy compared to the residential homes built under the 2016 standards. Additionally, after implementation of solar photovoltaic systems, homes built under the 2019 standards will use about 53% less energy than homes built under the 2016 standards. Nonresidential buildings (such as the Project) will use approximately 30% less energy due to lighting upgrade requirements (41).

Because the Project will be constructed after January 1, 2019, the 2019 CALGreen standards are applicable to the Project and require, among other items (20):

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. For new buildings with tenant spaces that have 10 or more tenant-occupants, provide secure bicycle parking for 5% of the tenant-occupant vehicular parking spaces with a minimum of one bicycle parking facility (5.106.4.1.2).
- Designated parking for clean air vehicles. In new projects or additions to alterations that add 10 or more vehicular parking spaces, provide designated parking for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles as shown in Table 5.106.5.2 (5.106.5.2).
- EV charging stations. New construction shall facilitate the future installation of EV supply equipment. The compliance requires empty raceways for future conduit and documentation that the electrical system has adequate capacity for the future load. The number of spaces to be provided for is contained in Table 5.106.5.3.3 (5.106.5.3).
- Outdoor light pollution reduction. Outdoor lighting systems shall be designed to meet the backlight, uplight and glare ratings per Table 5.106.8 (5.106.8)

- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section 5.408.1.1, 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1).
- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).
- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).
- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:
 - Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1)
 - Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor-mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).
 - Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 psi (5.303.3.3.1). When a shower is served by more than one showerhead, the combine flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (5.303.3.3.2).
 - Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).
- Outdoor potable water use in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient (MWELO), whichever is more stringent (5.304.1).
- Water meters. Separate submeters or metering devices shall be installed for new buildings or additions in excess of 50,000 sf or for excess consumption where any tenant within a new building or within an addition that is project to consume more than 1,000 gallons per day (5.303.1.1 and 5.303.1.2).
- Outdoor water use in rehabilitated landscape projects equal or greater than 2,500 sf. Rehabilitated landscape projects with an aggregate landscape area equal to or greater than 2,500 sf requiring a building or landscape permit (5.304.3).

- Commissioning. For new buildings 10,000 sf and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

MWELO

The MWELO was required by AB 1881, the Water Conservation Act. The bill required local agencies to adopt a local landscape ordinance at least as effective in conserving water as the Model Ordinance by January 1, 2010. Reductions in water use of 20% consistent with (SBX-7-7) 2020 mandate are expected upon compliance with the ordinance. Governor Brown's Drought Executive Order of April 1, 2015 (Executive Order B-29-15) directed Department of Water Resources (DWR) to update the Ordinance through expedited regulation. The California Water Commission approved the revised Ordinance on July 15, 2015 effective December 15, 2015. New development projects that include landscape areas of 500 sf or more are subject to the Ordinance. The update requires:

- More efficient irrigation systems;
- Incentives for graywater usage;
- Improvements in on-site stormwater capture;
- Limiting the portion of landscapes that can be planted with high water use plants; and
- Reporting requirements for local agencies.

CARB REFRIGERANT MANAGEMENT PROGRAM

CARB adopted a regulation in 2009 to reduce refrigerant GHG emissions from stationary sources through refrigerant leak detection and monitoring, leak repair, system retirement and retrofitting, reporting and recordkeeping, and proper refrigerant cylinder use, sale, and disposal. The regulation is set forth in sections 95380 to 95398 of Title 17, CCR. The rules implementing the regulation establish a limit on statewide GHG emissions from stationary facilities with refrigeration systems with more than 50 pounds of a high GWP refrigerant. The refrigerant management program is designed to (1) reduce emissions of high-GWP GHG refrigerants from leaky stationary, non-residential refrigeration equipment; (2) reduce emissions from the installation and servicing of refrigeration and air-conditioning appliances using high-GWP refrigerants; and (3) verify GHG emission reductions.

TRACTOR-TRAILER GHG REGULATION

The tractors and trailers subject to this regulation must either use EPA SmartWay certified tractors and trailers or retrofit their existing fleet with SmartWay verified technologies. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the heavy-duty tractors that pull them on California highways. These owners are responsible for replacing or retrofitting their affected vehicles with compliant aerodynamic technologies and low rolling resistance tires. Sleeper cab tractors model year 2011 and later must be SmartWay certified. All other tractors must use

SmartWay verified low rolling resistance tires. There are also requirements for trailers to have low rolling resistance tires and aerodynamic devices.

PHASE 1 AND 2 HEAVY-DUTY VEHICLE GHG STANDARDS

CARB has adopted a new regulation for GHG emissions from HDTs and engines sold in California. It establishes GHG emission limits on truck and engine manufacturers and harmonizes with the EPA rule for new trucks and engines nationally. Existing heavy-duty vehicle regulations in California include engine criteria emission standards, tractor-trailer GHG requirements to implement SmartWay strategies (i.e., the Heavy-Duty Tractor-Trailer GHG Regulation), and in-use fleet retrofit requirements such as the Truck and Bus Regulation. In September 2011, the EPA adopted their new rule for HDTs and engines. The EPA rule has compliance requirements for new compression and spark ignition engines, as well as trucks from Class 2b through Class 8. Compliance requirements begin with model year 2014 with stringency levels increasing through model year 2018. The rule organizes truck compliance into three groupings, which include a) heavy-duty pickups and vans; b) vocational vehicles; and c) combination tractors. The EPA rule does not regulate trailers.

CARB staff has worked jointly with the EPA and the NHTSA on the next phase of federal GHG emission standards for medium-duty trucks (MDT) and HDT vehicles, called federal Phase 2. The federal Phase 2 standards were built on the improvements in engine and vehicle efficiency required by the Phase 1 emission standards and represent a significant opportunity to achieve further GHG reductions for 2018 and later model year HDT vehicles, including trailers. But as discussed above, the EPA and NHTSA have proposed to roll back GHG and fuel economy standards for cars and light-duty trucks, which suggests a similar rollback of Phase 2 standards for MDT and HDT vehicles may be pursued.

In February 2019, the OAL approved the Phase 2 Heavy-Duty Vehicle GHG Standards and became effective April 1, 2019. The Phase 2 GHG standards are needed to offset projected VMT growth and keep heavy-duty truck CO₂ emissions declining. The federal Phase 2 standards establish for the first time, federal emissions requirements for trailers hauled by heavy-duty tractors. The federal Phase 2 standards are more technology-forcing than the federal Phase 1 standards, requiring manufacturers to improve existing technologies or develop new technologies to meet the standards. The federal Phase 2 standards for tractors, vocational vehicles, and heavy-duty pick-up trucks and vans (PUVs) will be phased-in from 2021-2027, additionally for trailers, the standards are phased-in from 2018 (2020 in California) through 2027 (42).

SB 97 AND THE CEQA GUIDELINES UPDATE

Passed in August 2007, SB 97 added Section 21083.05 to the Public Resources Code. The code states “(a) On or before July 1, 2009, the Office of Planning and Research (OPR) shall prepare, develop, and transmit to the Resources Agency guidelines for the mitigation of GHG emissions or the effects of GHG emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption. (b) On or before January 1, 2010, the Resources Agency shall certify and adopt guidelines prepared and developed by the OPR pursuant to subdivision (a).” Section 21097 was also added to the Public Resources Code. It

provided CEQA protection until January 1, 2010 for transportation projects funded by the Highway Safety, Traffic Reduction, Air Quality, and Port Security Bond Act of 2006 or projects funded by the Disaster Preparedness and Flood Prevention Bond Act of 2006, in stating that the failure to analyze adequately the effects of GHGs would not violate CEQA.

On December 28, 2018, the Natural Resources Agency announced the OAL approved the amendments to the *CEQA Guidelines* for implementing the CEQA. The CEQA Amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in CEQA documents. The CEQA Amendments fit within the existing CEQA framework by amending existing *CEQA Guidelines* to reference climate change.

Section 15064.4 was amended to state that in determining the significance of a project's GHG emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national, or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. Additionally, a lead agency may use a model or methodology to estimate GHG emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use (43).

2.7.4 REGIONAL

The project is within the SCAB, which is under the jurisdiction of the SCAQMD.

SCAQMD

SCAQMD is the agency responsible for air quality planning and regulation in the SCAB. The SCAQMD addresses the impacts to climate change of projects subject to SCAQMD permit as a lead agency if they are the only agency having discretionary approval for the project and acts as a responsible agency when a land use agency must also approve discretionary permits for the project. The SCAQMD acts as an expert commenting agency for impacts to air quality. This expertise carries over to GHG emissions, so the agency helps local land use agencies through the development of models and emission thresholds that can be used to address GHG emissions.

In 2008, SCAQMD formed a Working Group to identify GHG emissions thresholds for land use projects that could be used by local lead agencies in the SCAB. The Working Group developed several different options that are contained in the SCAQMD Draft Guidance Document – Interim CEQA GHG Significance Threshold, that could be applied by lead agencies. The working group has not provided additional guidance since release of the interim guidance in 2008. The SCAQMD Board has not approved the thresholds; however, the Guidance Document provides substantial evidence supporting the approaches to significance of GHG emissions that can be considered by

the lead agency in adopting its own threshold. The current interim thresholds consist of the following tiered approach:

- Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA.
- Tier 2 consists of determining whether the project is consistent with a GHG reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions.
- Tier 3 consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project is less than significant:
 - Residential and commercial land use: 3,000 MTCO₂e/yr
 - Industrial land use: 10,000 MTCO₂e/yr
 - Based on land use type: residential: 3,500 MTCO₂e/yr; commercial: 1,400 MTCO₂e/yr; or mixed use: 3,000 MTCO₂e/yr
- Tier 4 has the following options:
 - Option 1: Reduce Business-as-Usual (BAU) emissions by a certain percentage; this percentage is currently undefined.
 - Option 2: Early implementation of applicable AB 32 Scoping Plan measures
 - Option 3: 2020 target for service populations (SP), which includes residents and employees: 4.8 MTCO₂e per SP per year for projects and 6.6 MTCO₂e per SP per year for plans;
 - Option 3, 2035 target: 3.0 MTCO₂e per SP per year for projects and 4.1 MTCO₂e per SP per year for plans
- Tier 5 involves mitigation offsets to achieve target significance threshold.

The SCAQMD's interim thresholds used the Executive Order S-3-05-year 2050 goal as the basis for the Tier 3 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap CO₂ concentrations at 450 ppm, thus stabilizing global climate.

SCAQMD only has authority over GHG emissions from development projects that include air quality permits. At this time, it is unknown if the project would include stationary sources of emissions subject to SCAQMD permits. Notwithstanding, if the Project requires a stationary permit, it would be subject to the applicable SCAQMD regulations.

SCAQMD Regulation XXVII, adopted in 2009 includes the following rules:

- Rule 2700 defines terms and post global warming potentials.
- Rule 2701, SoCal Climate Solutions Exchange, establishes a voluntary program to encourage, quantify, and certify voluntary, high quality certified GHG emission reductions in the SCAQMD.

- Rule 2702, GHG Reduction Program created a program to produce GHG emission reductions within the SCAQMD. The SCAQMD will fund projects through contracts in response to requests for proposals or purchase reductions from other parties.

CITY OF LONG BEACH SUSTAINABLE CITY ACTION PLAN (SCAP)

The City of Long Beach adopted SCAP in February 2010. The SCAP identifies a wide range of measures potentially applicable to discretionary development that include energy conservation, water use reduction, address global warming, improve pedestrian options, transportation management and solid waste recycling. Specific goals related to GHG include reducing electricity use in city operations by 25% and community operations by 15% by 2020 (44). Although project plans have not yet been developed to identify specific project features that would support reductions in electrical usage, adjustments were made to the CalEEMod modeling to represent that the project would comply with the 2019 Title 24. As such, the Project would help conserve energy and would be consistent with the goals and initiatives of AB 32 and the Sustainable City Action Plan, no significant impacts would result from the proposed project, and no mitigation is required.

CITY OF LONG BEACH CLIMATE ACTION AND ADAPTION PLAN (CAAP)

The City of Long Beach released its Proposed CAAP on December 10, 2020. The CAAP is intended to be utilized for purposes of GHG streamlining and to satisfy the requirements needed *under CEQA Guidelines Section 15183* to be considered a qualified GHG reduction plan. Overall, the CAAP provides a framework for the City to reduce community-wide GHG emissions and comply with state regulations (i.e., SB 32), and to also address the effects of climate change on the community. Under the CAAP, the City aims to achieve a per SP emissions target of 3.04 MTCO₂e/SP for year 2030, which would coincide with the emissions reduction target established under SB 32. To achieve this target, the City would be required to reduce emissions by 192,659 MTCO₂e relative to the BAU emissions forecast for year 2030. In addition to the year 2030 target, the CAAP also includes a long-term net carbon neutrality goal for year 2045. This goal would require a reduction in GHG of 1,513,047 MTCO₂e. To meet the 2030 reduction target, the CAAP includes 21 mitigation actions covering the transportation, building energy, and waste sectors. Full implementation of these mitigation actions would reduce emissions in the transportation, building energy, and waste sectors by 8%, 68%, and 24%, respectively. In addition to mitigation actions, the CAAP also includes 40 various adaptation actions that addresses extreme heat, air quality, drought, and sea level rise and flooding. The City anticipates to adopt the CAAP in Fall 2021 (45).

2.8 THRESHOLDS OF SIGNIFICANCE

The City of Long Beach has not established local CEQA significance thresholds for GHG emissions, as described in Section 15064.7 of the CEQA guidelines. According to the Final Statement of Reasons (FSOR) for Regulatory Action, the revised Section 15064.7 gives lead agencies the discretion to determine their methodology for a significance threshold for GHG emissions (46).

For CEQA purposes, the City has discretion to select an appropriate significance criterion, based on substantial evidence. The SCAQMD's adopted numerical threshold of 10,000 MTCO₂e/yr for

industrial stationary source emissions is selected as the significance criterion. The SCAQMD-adopted industrial threshold was selected by the City because the proposed Project is more analogous to an industrial use than any other land use such as commercial or residential in terms of its expected operating characteristics. The Project proposes a warehouse use that will serve mid-stream functions in the goods movement chain between manufacturers and consumers, characteristic of an industrial operation. Further, analysis of the Project's traffic generation in this report is based on the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition, 2017 for warehouse and industrial land use categories. Also, 10,000 MTCO₂e/yr has been used as the significance threshold by many local government lead agencies for logistics projects throughout the SCAG region since the SCAQMD adopted this threshold for its own use. Further, to ensure that the threshold is conservative in its application, although the SCAQMD uses their adopted 10,000 MTCO₂e/yr threshold to determine the significance of stationary source emissions for industrial projects, the 10,000 MTCO₂e/yr threshold used in this CEQA document is applied to all sources of Project-related GHG emissions whether stationary source, mobile source, area source, or other.

Use of this threshold is also consistent with guidance provided in the CAPCOA *CEQA and Climate Change* handbook, as such, the City has opted to use a non-zero threshold approach based on Approach 2 of the handbook. Threshold 2.5 (Unit-Based Thresholds Based on Market Capture) establishes a numerical threshold based on capture of approximately 90% of emissions from future development. The latest threshold developed by SCAQMD using this method is 10,000 MTCO₂e/yr based on the review of 711 CEQA projects. As such, the City has selected the South Coast Air Quality Management District's numeric significance threshold of 10,000 MTCO₂e/yr.

This analysis also analyzes the Project's GHG emissions based on consistency with the 2017 *Scoping Plan*, the City's SCAP, and the Proposed CAAP.

3 PROJECT GHG IMPACT

3.1 INTRODUCTION

The Project has been evaluated to determine if it will result in a significant GHG impact. The significance of these potential impacts is described in the following sections.

3.2 STANDARDS OF SIGNIFICANCE

The criteria used to determine the significance of potential Project-related GHG impacts are taken from the Initial Study Checklist in Appendix G of the State *CEQA Guidelines* (14 CCR of Regulations §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to GHG if it would (2):

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

3.3 MODELS EMPLOYED TO ANALYZE GHGS

3.3.1 CALIFORNIA EMISSIONS ESTIMATOR MODEL (CALEEMOD)

On October 17, 2017, the SCAQMD, in conjunction with the California Air Pollution Control Officers Association (CAPCOA) and other California air districts, released the latest version of the CalEEMod Version 2016.3.2. The purpose of this model is to calculate construction-source and operational-source criteria pollutants and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures (47). Accordingly, the latest version of CalEEMod has been used for this Project to determine GHG emissions. Output from the model runs for construction and operational activity are provided in Appendices 3.1 through 3.3. CalEEMod includes GHG emissions from the following source categories: construction, area, energy, mobile, waste, water.

3.3.2 EMFAC2017 EMISSION RATES

On August 19, 2019, the EPA approved the 2017 version of the EMISSIONS FACTOR model (EMFAC) web database for use in State Implementation Plan and transportation conformity analyses. EMFAC2017 is a mathematical model that was developed to calculate emission rates, fuel consumption, VMT from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by CARB to project changes in future emissions from on-road mobile sources (48). This GHGA utilizes annual EMFAC2017 emission factors in order to derive vehicle emissions associated with Project operational activities.

Because the EMFAC2017 emission rates are associated with vehicle fuel types while CalEEMod vehicle emission factors are aggregated to include all fuel types for each individual vehicle class, the EMFAC2017 emission rates for different fuel types of a vehicle class are averaged by activity

or by population and activity to derive CalEEMod emission factors. The equations applied to obtain CalEEMod vehicle emission factors for each emission type are detailed in CalEEMod User's Guide *Appendix A: Calculation Details for CalEEMod* (49).

3.4 LIFE-CYCLE ANALYSIS NOT REQUIRED

A full life-cycle analysis (LCA) for construction and operational activity is not included in this analysis due to the lack of consensus guidance on LCA methodology at this time (50). Life-cycle analysis (i.e., assessing economy-wide GHG emissions from the processes in manufacturing and transporting all raw materials used in the Project development, infrastructure, and on-going operations) depends on emission factors or econometric factors that are not well established for all processes. At this time, an LCA would be extremely speculative and thus has not been prepared. Additionally, the SCAQMD recommends analyzing direct and indirect project GHG emissions generated within California and not life-cycle emissions because the life-cycle effects from a project could occur outside of California, might not be very well understood or documented, and would be challenging to mitigate (51). Additionally, the science to calculate life cycle emissions is not yet established or well defined; therefore, SCAQMD has not recommended, and is not requiring, life-cycle emissions analysis.

3.5 CONSTRUCTION EMISSIONS

3.5.1 CONSTRUCTION ACTIVITIES

Project construction activities would generate CO₂ and CH₄ emissions. The report *San Francisco Avenue Air Quality Impact Analysis Report* (AQIA) contains detailed information regarding Project construction activities (52). As discussed in the AQIA, Construction related emissions are expected from the following construction activities:

- Demolition/Crushing
- Site Preparation
- Grading
- Building Construction
- Architectural Coating

3.5.2 CONSTRUCTION DURATION

For purposes of analysis, construction of Project is expected to commence in October 2021 and be completed in November 2022. The construction schedule utilized in the analysis, shown in Table 3-1, represents a "worst-case" analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as time passes and the analysis year increases due to emission regulations becoming more stringent⁴. The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per *CEQA Guidelines* (53).

⁴ As shown in the CalEEMod User's Guide Version 2016.3.2, Section 4.3 "OFFROAD Equipment" as the analysis year increases, emission factors for the same equipment pieces decrease due to the natural turnover of older equipment being replaced by newer less polluting equipment and new regulatory requirements.

TABLE 3-1: CONSTRUCTION DURATION

Phase Name	Start Date	End Date	Days
Demolition/Crushing	10/04/2021	10/29/2021	20
Site Preparation	10/30/2021	11/12/2021	10
Grading	11/13/2021	12/10/2021	20
Building Construction	12/11/2021	10/28/2022	230
Paving	10/29/2022	11/25/2022	20
Architectural Coating	10/01/2022	11/25/2022	40

3.5.3 CONSTRUCTION EQUIPMENT

A summary of construction equipment by phase is provided at Table 3-2. Consistent with industry standards and typical construction practices, each piece of equipment listed in Table 3-2 will operate up to a total of eight (8) hours per day, or more than two-thirds of the period during which construction activities are allowed pursuant to the City of Long Beach Municipal Code.

TABLE 3-2: CONSTRUCTION EQUIPMENT ASSUMPTIONS (1 OF 2)

Phase Name	Equipment	Amount	Hours Per Day
Demolition	Concrete/Industrial Saws	1	8
	Crushing/Proc. Equipment	1	8
	Excavators	3	8
	Rubber Tired Dozers	2	8
Site Preparation	Crawler Tractors	4	8
	Rubber Tired Dozers	3	8
Grading	Crawler Tractors	3	8
	Excavators	1	8
	Graders	1	8
	Rubber Tired Dozers	1	8
Building Construction	Cranes	1	8
	Crawler Tractors	3	8
	Forklifts	3	8
	Generator Sets	1	8
	Welders	1	8
Paving	Pavers	2	8
	Paving Equipment	2	8
	Rollers	2	8
Architectural Coating	Air Compressors	1	8

3.5.4 CONSTRUCTION EMISSIONS SUMMARY

For construction phase Project emissions, GHGs are quantified and amortized over the life of the Project. To amortize the emissions over the life of the Project, the SCAQMD recommends calculating the total GHG emissions for the construction activities, dividing it by a 30-year Project life then adding that number to the annual operational phase GHG emissions (54). As such, construction emissions were amortized over a 30-year period and added to the annual operational phase GHG emissions. The amortized construction emissions are presented in Table 3-3.

TABLE 3-3: AMORTIZED ANNUAL CONSTRUCTION EMISSIONS

Year	Emissions (MT/yr)			
	CO ₂	CH ₄	N ₂ O	Total CO ₂ e ⁵
2021	176.47	0.04	0.00	177.48
2022	716.84	0.13	0.00	720.04
Total GHG Emissions	893.31	0.17	0.00	897.52
Amortized Construction Emissions (MTCO₂e)	29.78	0.01	0.00	29.92

3.6 OPERATIONAL EMISSIONS

Operational activities associated with the Project will result in emissions of CO₂, CH₄, and N₂O from the following primary sources:

- Area Source Emissions
- Energy Source Emissions
- Mobile Source Emissions
- On-Site Cargo Handling Equipment Emissions
- Water Supply, Treatment, and Distribution
- Solid Waste

3.6.1 AREA SOURCE EMISSIONS

LANDSCAPE MAINTENANCE EQUIPMENT

Landscape maintenance equipment would generate emissions from fuel combustion and evaporation of unburned fuel. Equipment in this category would include lawnmowers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers used to maintain the landscaping of the Project. The emissions associated with landscape maintenance equipment were calculated based on assumptions provided in CalEEMod.

⁵ CalEEMod reports the most common GHGs emitted which include CO₂, CH₄, and N₂O. These GHGs are then converted into the CO₂e by multiplying the individual GHG by the GWP.

3.6.2 ENERGY SOURCE EMISSIONS

COMBUSTION EMISSIONS ASSOCIATED WITH NATURAL GAS AND ELECTRICITY

GHGs are emitted from buildings as a result of activities for which electricity and natural gas are typically used as energy sources. Combustion of any type of fuel emits CO₂ and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building; the building energy use emissions do not include street lighting⁶. GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered to be indirect emissions. For the proposed Project, CalEEMod default parameters were used.

TITLE 24 ENERGY EFFICIENCY STANDARDS

The CalEEMod defaults for Title 24 – Electricity and Lighting Energy were reduced by 30% in order to reflect consistency with the 2019 Title 24 standard.

3.6.3 MOBILE SOURCE EMISSIONS

The Project related GHG emissions derive primarily from vehicle trips generated by the Project, including employee trips to and from the site and truck trips associated with the proposed uses. As summarized in the *San Francisco Avenue Trip Generation Assessment*, the Project is expected to generate approximately 308 two-way vehicular trips (154 inbound and 154 outbound) which includes 26 two-way truck trips per day (13 inbound and 13 outbound) associated with the General Light Industrial land use and approximately 108 two-way vehicular trips (54 inbound and 54 outbound) which includes 30 two-way truck trips per day (15 inbound and 15 outbound) associated with the Warehouse land use (56).

APPROACH FOR ANALYSIS OF THE PROJECT

To determine emissions from passenger car vehicles, the CalEEMod defaults were utilized for trip length and trip purpose for the proposed industrial land uses. For the proposed industrial uses, it is important to note that although the *San Francisco Avenue Trip Generation Assessment* does not breakdown passenger cars by type, this analysis assumes that passenger cars include Light-Duty-Auto vehicles (LDA), Light-Duty-Trucks (LDT1⁷ & LDT2⁸), Medium-Duty-Vehicles (MDV), Motorcycles (MCY) vehicle types. To account for emissions generated by passenger cars, the following fleet mix was utilized in this analysis:

⁶ The CalEEMod emissions inventory model does not include indirect emission related to street lighting. Indirect emissions related to street lighting are expected to be negligible and cannot be accurately quantified at this time as there is insufficient information as to the number and type of street lighting that would occur.

⁷ Vehicles under the LDT1 category have a gross vehicle weight rating (GVWR) of less than 6,000 lbs. and equivalent test weight (ETW) of less than or equal to 3,750 lbs.

⁸ Vehicles under the LDT2 category have a GVWR of less than 6,000 lbs. and ETW between 3,751 lbs. and 5,750 lbs.

TABLE 3-4: PASSENGER CAR FLEET MIX

Land Use	Vehicle Type	%
General Light Industrial	LDA	59.34
	LDT1	4.88
	LDT2	22.15
	MDV	13.07
	MCY	0.56
Warehouse	LDA	59.34
	LDT1	4.88
	LDT2	22.15
	MDV	13.07
	MCY	0.56

Note: The Project-specific passenger car fleet mix used in this analysis is based on a proportional split utilizing the default CalEEMod percentages assigned to LDA, LDT1, LDT2, MDV, MCY vehicle types.

To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 40 miles⁹ and an assumption of 100% primary trips for the proposed industrial land uses. In order to be consistent with the *San Francisco Avenue Trip Generation Assessment*, trucks are broken down by truck type. The truck fleet mix is estimated by rationing the trip rates for each truck type based on information provided in the *San Francisco Avenue Trip Generation Assessment*. Heavy trucks are broken down by truck type (or axle type) and are categorized as either Light-Heavy-Duty Trucks (LHDT1¹⁰ & LHDT2¹¹)/2-axle, Medium-Heavy-Duty Trucks (MHDT)/3-axle, and Heavy-Heavy-Duty Trucks (HHDT)/4+-axle. To account for emissions generated by trucks, the following fleet mix was utilized in this analysis:

TABLE 3-5: TRUCK FLEET MIX (1 OF 2)

Land Use	Vehicle Type	%
General Light Industrial	LHDT1	12.18
	LHDT2	4.80
	MHDT	20.75
	HHDT	62.27

⁹ The average trip length for heavy trucks were based on the SCAQMD documents for the implementation of the Facility-Based Mobile Source Measures (FBMSMs) adopted in the 2016 AQMP. SCAQMD's "Preliminary Warehouse Emission Calculations" cites 39.9-mile trip length for heavy-heavy trucks (41). As a conservative measure, a trip length of 40 miles has been utilized for all trucks for the purpose of this analysis (39)

¹⁰ Vehicles under the LHDT1 category have a GVWR of 8,501 to 10,000 lbs.

¹¹ Vehicles under the LHDT2 category have a GVWR of 10,001 to 14,000 lbs.

TABLE 3-5: TRUCK FLEET MIX (2 OF 2)

Land Use	Vehicle Type	%
Warehouse	LHDT1	12.18
	LHDT2	4.80
	MHDT	20.75
	HHDT	62.27

Note: Project-specific truck fleet mix is based on the number of trips generated by each truck type (LHDT1, LHDT2, MHDT, and HHDT) relative to the total number of truck trips.

3.6.4 ON-SITE CARGO HANDLING EQUIPMENT EMISSIONS

It is common for industrial warehouse buildings to require cargo handling equipment to move empty containers and empty chassis to and from the various pieces of cargo handling equipment that receive and distribute containers. For purposes of analysis, it is assumed that the Project would require on-site operational equipment of up to two (2) 200 horsepower (hp), compressed natural gas or gasoline-powered tractors/loaders/backhoes operating at 4 hours a day for 365 days of the year.

3.6.5 WATER SUPPLY, TREATMENT AND DISTRIBUTION

Indirect GHG emissions result from the production of electricity used to convey, treat, and distribute water and wastewater. The amount of electricity required to convey, treat, and distribute water depends on the volume of water as well as the sources of the water. Unless otherwise noted, CalEEMod default parameters were used.

3.6.6 SOLID WASTE

Industrial land uses will result in the generation and disposal of solid waste. A percentage of this waste will be diverted from landfills by a variety of means, such as reducing the amount of waste generated, recycling, and/or composting. The remainder of the waste not diverted will be disposed of at a landfill. GHG emissions from landfills are associated with the anaerobic breakdown of material. GHG emissions associated with the disposal of solid waste associated with the proposed Project were calculated by CalEEMod using default parameters.

3.6.7 EMISSIONS SUMMARY

The annual GHG emissions associated with the Project are summarized in Table 3-6. As shown in Table 3-6, construction and operation of the Project would generate a net total of approximately 1,991.42 MTCO₂e/yr.

TABLE 3-7: PROPOSED PROJECT GHG EMISSIONS

Emission Source	Emissions (MT/yr)
	Total CO ₂ e
Annual construction-related emissions amortized over 30 years	29.92
Area Source	0.02
Energy Source	267.50
Mobile Source	1,386.46
On-Site Equipment	102.41
Waste	67.79
Water Usage	137.33
Total CO₂e (All Sources)	1,991.42

3.7 COMPARISON TO ANALYSIS IN *LUE EIR*

This section summarizes the Project's emissions impacts in this GHGA as compared to the emissions totals and impacts that were identified in the *LUE EIR* (1).

3.7.1 *LUE EIR* OPERATIONAL EMISSIONS

Tables 3-8 shows the GHG emissions associated with buildout of the *LUE EIR* (1).

TABLE 3-8: *LUE EIR* GHG EMISSIONS

Emission Source	Emissions (MT/yr)
	Total CO ₂ e
Area Source	37,347.00
Energy Source	518,999.00
Mobile Source	890,829.00
Waste	135,892.00
Water Usage	87,351.00
Total CO₂e (All Sources)	1,670,419

3.7.2 CURRENTLY ADOPTED GENERAL PLAN LAND USE GHG EMISSIONS

This section summarizes the Project's emissions impacts in this GHGA as compared to the emissions totals that would occur if the site were built under the currently adopted land use. Building 1 is located on a vacant parcel (currently paved for parking, no building). However, Building 2 is currently being utilized for long-term contractor parking. The site is currently occupied by a 19,300-sf building in the northeast corner of the site. Both sites for Buildings 1 and 2 are designated for Light Industrial use. The City's General Plan (December 2019) identifies the existing land use on the site as Neo-Industrial, which allows non-residential development at an

intensity of 0.5-1.00 floor to area ratio (FAR) of industrial uses. As such, the existing 6.31-acre site currently assumes between 137,432 sf to 274,864 sf of light industrial uses. The GHG emissions are shown on Table 3-9 for the currently adopted land use.

TABLE 3-9: CURRENTLY ADOPTED GENERAL PLAN LAND USE GHG EMISSIONS

Emission Source	Emissions (MT/yr)
	Total CO ₂ e
Area Source	7.35E-03
Energy Source	525.68
Mobile Source	947.75
On-Site Equipment	51.20
Waste	85.70
Water Usage	149.64
Total CO₂e (All Sources)	1,759.97

3.7.3 COMPARISON OF THE PROPOSED PROJECT TO THE CURRENTLY ADOPTED GENERAL PLAN LAND USE

As shown in Table 3-10 the proposed Project is anticipated to generate less GHG emissions as compared to the emissions generated by currently adopted land use.

TABLE 3-10: GHG EMISSIONS COMPARISON

Emission Source	Emissions (MT/yr)
	Total CO ₂ e
Proposed Project	1,991.42
Currently Adopted Land Use	1,759.97
Net (Project – Currently Adopted)	231.45

3.8 GHG EMISSIONS FINDINGS AND RECOMMENDATIONS

3.8.1 GHG IMPACT 1

Potential to generate direct or indirect GHG emissions that would result in a significant impact on the environment.

The City of Long Beach does not have an adopted threshold of significance for GHG emissions. For CEQA purposes, the City has discretion to select an appropriate significance criterion, based on substantial evidence. The AQMD's adopted numerical threshold of 10,000 MTCO₂e/yr for industrial stationary source emissions is selected as the significance criterion. The SCAQMD-adopted industrial threshold was selected by the City because the proposed Project is analogous to an industrial use much more closely than any other land use such as commercial or residential in terms of its expected operating characteristics. The Project proposes a single warehouse building, characteristic of an industrial operation. Further, analysis of the Project's

traffic generation is based on the ITE Trip Generation Manual, 10th Edition, 2017 for industrial and warehouse uses. Also, 10,000 MTCO₂e/yr has been used as the significance threshold by many local government lead agencies for logistics projects throughout the SCAG region since the SCAQMD adopted this threshold for its own use. Further, to ensure that the threshold is conservative in its application, although the SCAQMD uses their adopted 10,000 MTCO₂e/yr threshold to determine the significance of stationary source emissions for industrial projects, the 10,000 MTCO₂e/yr threshold used in this analysis is applied to all sources of Project-related GHG emissions whether stationary source, mobile source, area source, or other.

Use of this threshold is also consistent with guidance provided in the CAPCOA *CEQA and Climate Change* handbook, as such the City has opted to use a non-zero threshold approach based on Approach 2 of the handbook. Threshold 2.5 (Unit-Based Thresholds Based on Market Capture) establishes a numerical threshold based on capture of approximately 90% of emissions from future development. The latest threshold developed by SCAQMD using this method is 10,000 MTCO₂e/yr for industrial projects. This threshold is based on the review of 711 CEQA projects.

As shown on Table 3-7, the Project will result in approximately 1,991.42 MTCO₂e/yr; the proposed project would not exceed the SCAQMD/City's screening threshold of 10,000 MTCO₂e/yr. Thus, project-related emissions would not have a significant direct or indirect impact on GHG and climate change and no mitigation or further analysis is required.

The Project would have the potential generate GHG emissions either directly or indirectly that would result in a significant impact on the environment.

3.8.2 GHG IMPACT 2

The Project would have the potential to conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

As previously stated, pursuant to 15604.4 of the CEQA Guidelines, a lead agency may rely on qualitative analysis or performance-based standards to determine the significance of impacts from GHG emissions (43).

In November 2017, CARB released the Final 2017 Scoping Plan Update, which identifies the State's post-2020 reduction strategy. As Project building is anticipated to occur in 2023, consistency with SB 32 is discussed below.

CONSISTENCY WITH SB 32 (2017 SCOPING PLAN UPDATE)

The 2017 Scoping Plan Update reflects the 2030 target of a 40% reduction below 1990 levels, set by Executive Order B-30-15 and codified by SB 32. Table 3-11 summarizes the project's consistency with the 2017 Scoping Plan. As summarized, the Project will not conflict with any of the provisions of the Scoping Plan and in fact supports seven of the action categories.

TABLE 3-11: 2017 SCOPING PLAN CONSISTENCY SUMMARY¹²

Action	Responsible Parties	Consistency
Implement SB 350 by 2030		
Increase the Renewables Portfolio Standard to 50% of retail sales by 2030 and ensure grid reliability.	CPUC, CEC, CARB	Consistent. The Project would use energy from Southern California Edison (SCE). SCE has committed to diversify its portfolio of energy sources by increasing energy from wind and solar sources. The Project would not interfere with or obstruct SCE energy source diversification efforts.
Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030.		Consistent. The Project would be designed and constructed to implement the energy efficiency measures for new commercial developments and would include several measures designed to reduce energy consumption. The Project would not interfere with or obstruct policies or strategies to establish annual targets for statewide energy efficiency savings and demand reduction.
Reduce GHG emissions in the electricity sector through the implementation of the above measures and other actions as modeled in Integrated Resource Planning (IRP) to meet GHG emissions reductions planning targets in the IRP process. Load-serving entities and publicly- owned utilities meet GHG emissions reductions planning targets through a combination of measures as described in IRPs.		Consistent. The proposed Project would be designed and constructed to implement the energy efficiency measures, where applicable by including several measures designed to reduce energy consumption. The proposed Project includes energy efficient field lighting and fixtures that meet the current Title 24 Standards throughout the Project Site and would be a modern development with energy efficient boilers, heaters, and air conditioning systems.
Implement Mobile Source Strategy (Cleaner Technology and Fuels)		
At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025.	CARB, California State Transportation Agency (CalSTA), Strategic Growth Council (SGC), California Department of Transportation (Caltrans), CEC, OPR, Local Agencies	Consistent. This is a CARB Mobile Source Strategy. The Project would not obstruct or interfere with CARB zero emission and plug-in hybrid light-duty electric vehicle 2025 targets.
At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030.		Consistent. This is a CARB Mobile Source Strategy. The Project would not obstruct or interfere with CARB zero emission and plug-in hybrid light-duty electric vehicle 2030 targets.
Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean cars regulations.		Consistent. This is a CARB Mobile Source Strategy. The Project would not obstruct or interfere with CARB efforts to further increase GHG stringency on all light-duty

¹² Measures can be found at the following link: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf

Action	Responsible Parties	Consistency
		vehicles beyond existing Advanced Clean cars regulations.
Medium- and Heavy-Duty GHG Phase 2.		Consistent. This is a CARB Mobile Source Strategy. The Project would not obstruct or interfere with CARB efforts to implement Medium- and Heavy-Duty GHG Phase 2.
Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20% of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100% of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low-NO _x standard.		Consistent. This is a CARB Mobile Source Strategy. The Project would not obstruct or interfere with CARB efforts improve transit-source emissions.
Last Mile Delivery: New regulation that would result in the use of low NO _x or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for class 3-7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5% of new Class 3-7 truck sales in local fleets starting in 2020, increasing to 10% in 2025 and remaining flat through 2030.		Consistent. This is a CARB Mobile Source Strategy. The Project would not obstruct or interfere with CARB efforts to improve last mile delivery emissions.
Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document "Potential VMT Reduction Strategies for Discussion."		Consistent. This Project would not obstruct or interfere with implementation of SB 375 and would therefore not conflict with this measure.
Increase stringency of SB 375 Sustainable Communities Strategy (2035 targets).	CARB	Consistent. This is a CARB Mobile Source Strategy. The Project would not obstruct or interfere with CARB efforts to Increase stringency of SB 375 Sustainable Communities Strategy (2035 targets), which apply to passenger vehicles.

Action	Responsible Parties	Consistency
Harmonize project performance with emissions reductions and increase competitiveness of transit and active transportation modes (e.g., via guideline documents, funding programs, project selection, etc.).	CalSTA, SGC, OPR, CARB, Governor's Office of Business and Economic Development (GO- Biz), California Infrastructure and Economic Development Bank (IBank), Department of Finance (DOF), California Transportation Commission (CTC), Caltrans	Consistent. The Project would not obstruct or interfere with agency efforts to harmonize transportation facility project performance with emissions reductions and increase competitiveness of transit and active transportation modes.
By 2019, develop pricing policies to support low-GHG transportation (e.g., low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts).	CalSTA, Caltrans, CTC, OPR, SGC, CARB	Consistent. The Project would not obstruct or interfere with agency efforts to develop pricing policies to support low-GHG transportation.
Implement California Sustainable Freight Action Plan		
Improve freight system efficiency.	CalSTA, CalEPA, CNRA, CARB, Caltrans, CEC, GO-Biz	Consistent. This measure would apply to all trucks accessing the Project site, this may include existing trucks or new trucks that are part of the statewide goods movement sector. The Project would not obstruct or interfere with agency efforts to Improve freight system efficiency.
Deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.		Consistent. The Project would not obstruct or interfere with agency efforts to deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.

Action	Responsible Parties	Consistency
Adopt a Low Carbon Fuel Standard with a Carbon Intensity reduction of 18%.	CARB	Consistent. When adopted, this measure would apply to all fuel purchased and used by the Project in the state. The Project would not obstruct or interfere with agency efforts to adopt a Low Carbon Fuel Standard with a Carbon Intensity reduction of 18%.
Implement the Short-Lived Climate Pollutant Strategy (SLPS) by 2030		
40% reduction in methane and hydrofluorocarbon emissions below 2013 levels.	CARB, CalRecycle, CDFA, SWRCB, Local Air Districts	Consistent. The Project would be required to comply with this measure and reduce any Project-source SLPS emissions accordingly. The Project would not obstruct or interfere agency efforts to reduce SLPS emissions.
50% reduction in black carbon emissions below 2013 levels.		
By 2019, develop regulations and programs to support organic waste landfill reduction goals in the SLCP and SB 1383.	CARB, CalRecycle, CDFA SWRCB, Local Air Districts	Consistent. The Project would implement waste reduction and recycling measures consistent with State and City requirements. The Project would not obstruct or interfere agency efforts to support organic waste landfill reduction goals in the SLCP and SB 1383.
Implement the post-2020 Cap-and-Trade Program with declining annual caps.	CARB	Consistent. The Project would be required to comply with any applicable Cap-and-Trade Program provisions. The Project would not obstruct or interfere agency efforts to implement the post-2020 Cap-and-Trade Program.
By 2018, develop Integrated Natural and Working Lands Implementation Plan to secure California's land base as a net carbon sink		
Protect land from conversion through conservation easements and other incentives.	CNRA, Departments Within CDFA,	Consistent. The Project would not obstruct or interfere agency efforts to protect land from conversion through

Action	Responsible Parties	Consistency
	CalEPA, CARB	conservation easements and other incentives.
Increase the long-term resilience of carbon storage in the land base and enhance sequestration capacity		Consistent. The Project would not obstruct or interfere agency efforts to increase the long-term resilience of carbon storage in the land base and enhance sequestration capacity.
Utilize wood and agricultural products to increase the amount of carbon stored in the natural and built environments		Consistent. Where appropriate, Project designs will incorporate wood or wood products. The Project would not obstruct or interfere agency efforts to encourage use of wood and agricultural products to increase the amount of carbon stored in the natural and built environments.
Establish scenario projections to serve as the foundation for the Implementation Plan		Consistent. The Project would not obstruct or interfere agency efforts to establish scenario projections to serve as the foundation for the Implementation Plan.
Establish a carbon accounting framework for natural and working lands as described in SB 859 by 2018	CARB	Consistent. The Project would not obstruct or interfere agency efforts to establish a carbon accounting framework for natural and working lands as described in SB 859 by 2018.
Implement Forest Carbon Plan	CNRA, California Department of Forestry and Fire Protection (CAL FIRE), CalEPA and Departments Within	Consistent. The Project would not obstruct or interfere agency efforts to implement the Forest Carbon Plan.
Identify and expand funding and financing mechanisms to support GHG reductions across all sectors.	State Agencies & Local Agencies	Consistent. The Project would not obstruct or interfere agency efforts to identify and expand funding and financing mechanisms to support GHG reductions across all sectors.

As shown above, the Project would not conflict with any of the 2017 Scoping Plan elements as any regulations adopted would apply directly or indirectly to the Project. Further, recent studies show that the State's existing and proposed regulatory framework will allow the State to reduce its GHG emissions level to 40% below 1990 levels by 2030 (38). Notwithstanding, the Project would result in a significant and unavoidable impact with respect to this threshold, as the Project exceeds the applicable numeric screening thresholds for GHG emissions and therefore has potential to impede the State's ability to achieve the 40% below 1990 level reduction target.

CITY OF LONG BEACH SCAP

Although project plans have not yet been developed to identify specific project features that would support reductions in electrical usage, adjustments were made to the CalEEMod modeling to represent that the project would comply with the 2019 Title 24. As such, the Project would help conserve energy and would be consistent with the goals and initiatives of AB 32 and the SCAP, no significant impacts would result from the proposed project, and no mitigation is required.

CITY OF LONG BEACH CAAP

Table 3-12 evaluates consistency of the Project to the proposed CAAP. Specifically, the Project is compared to the CAAP goals that relate to and are associated with providing emissions reductions.

TABLE 3-12: CITY OF LONG BEACH CAAP CONSISTENCY SUMMARY¹³

Objective	No.	Action	Consistency
Extreme Heat: Long Beach buildings, neighborhoods, and infrastructure are climate resilient, reduce the urban heat island effect, and are set up to ensure and improve public health and safety in the face of extreme heat events			
New and existing buildings, streets, and public spaces reduce extreme heat through incorporation of cool surfaces and green infrastructure	EH-1	Increase presence of cool roofs and cool walls	Consistent. The Project would be developed to include cool surfaces and green infrastructure.
	EH-2	Increase the presence of reflective streets, cool surfaces, and shade canopies	
	EH-3	Enhance and expand urban forest cover and vegetation	
All residents have access to services	EH-4	Install additional water fountains and	

¹³ Measures can be found at the following link: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf

Objective	No.	Action	Consistency
and programs to withstand extreme heat events		other actions to increase public access to water	Consistent. The Project would be developed so that all residents have access to services and programs to withstand extreme heat events.
	EH-5	Identify future vulnerability potential for power outages related to extreme heat and develop plans to prevent such outages	
	EH-6	Enhance and expand the accessibility of cooling centers	
Public transit is a comfortable and viable mobility option during extreme heat events, especially for transit-dependent populations	EH-7	Provide bus shelter amenities	Consistent. The Project would not obstruct or interfere efforts to comply with the objectives outlined for EH-7 and EH-8.
	EH-8	Improve beach and coastal transit access during extreme heat events	
Air Quality: All Long Beach communities have clean air and improved public health			
Buildings and facilities actively reduce air pollution as a component of a broader energy reduction strategy	AQ-1	Incentivize installation of photocatalytic tiles	Consistent. The Project would be developed to reduce air pollution as a component of a broader energy reduction strategy.
	AQ-2	Encourage urban agriculture practices that reduce air quality pollution	
Emissions are reduced by shifting to cleaner equipment and vehicles	AQ-3	Support the development of the Long Beach Airport Sustainability Plan	Not Applicable. This is not a project-specific goal and is therefore not applicable.

Objective	No.	Action	Consistency
	AQ-4	Electrify small local emitters, such as lawn and garden equipment, outdoor power equipment, and others	
	AQ-5	Work with Long Beach Unified School District (LBUSD) to support school bus electrification	
	AQ-6	Implement the Port of Long Beach Clean Air Action Plan	
Air quality impacts from local oil and gas operations are minimized	AQ-7	Increase monitoring and regulation of oil extraction and refining process	Not Applicable. This is not a project-specific goal and is therefore not applicable.
Drought: Long Beach has a more sustainable and diverse water supply that reduces dependence on imported water and improves long-term water security			
Maximize water efficiency and conservation	DRT-1	Continue development and implementation of water use efficiency programs and implement additional water conservation programs	Consistent: Project development will include all State mandated water saving features, including water-efficient faucets, showerheads, and toilets.
	DRT-2	Enhance outreach and education related to water conservation	

Objective	No.	Action	Consistency
Maximize water that is captured and reused locally	DRT-3	Expand usage of green infrastructure and green streets	Consistent. The Project would not obstruct or interfere efforts to comply with the objectives outlined for DRT-3, DRT-4, and DRT-5.
	DRT-4	Expand usage of recycled water and greywater for non-potable use	
	DRT-5	Incorporate increased rainfall capture and other actions to maximize local water supplies and offset imported water	
Sea Level Rise & Flooding: Long Beach understands and is prepared for its future flood risk			
Short-Term Action (to 2030) City plans and policies are forward-looking and ensure projects and investments account for projected sea level and flooding impacts	FLD-1	Update and augment floodplain regulations as necessary	Not Applicable. This is not a project-specific goal and is therefore not applicable.
	FLD-2	Incorporate sea level rise language into citywide plans, policies, and regulations	
	FLD-3	Establish a flood impacts monitoring program	
	FLD-4	Incorporate adaptation into City lease negotiations	

Objective	No.	Action	Consistency
	FLD-5	Update the City’s existing Stormwater Management Plan	
Clear and sufficient information is on hand to identify and prioritize near-term adaptation needs and best practices	FLD-6	Conduct citywide beach stabilization study	Not Applicable. This is not a project-specific goal and is therefore not applicable.
	FLD-7	Review and conduct studies of combined riverine/coastal flooding and increased severity of rainfall events on watershed flooding	
Adaptation strategies are implemented to protect vulnerable shoreline areas and wastewater infrastructure	FLD-8	Enhance dunes	Not Applicable. This is not a project-specific goal and is therefore not applicable.
	FLD-9	Inventory and flood-proof vulnerable sewer pump stations	
Building & Energy: Long Beach buildings are energy-efficient and our communities run on affordable, renewable electricity			
Transition to a carbon-free, more resilient electricity system	BE-1	Provide access to renewably generated electricity	Consistent. The Project would not obstruct or interfere efforts to comply with the objectives outlined for BE-1, BE-2, and BE-3.
	BE-2	Increase use of solar power	
	BE-3	Promote community and solar microgrids	
Increase the energy efficiency of existing buildings/facilities	BE-4	Develop a residential and commercial energy assessment and benchmarking program	Not Applicable. This is not a project-specific goal and is therefore not applicable.

Objective	No.	Action	Consistency
	BE-5	Provide access to energy efficiency financing, rebates, and incentives for building owners	
	BE-6	Perform municipal energy audits	
Ensure new buildings are low-carbon or carbon neutral	BE-7	Update building codes to incentivize electric new residential and commercial buildings	Not Applicable. This is not a project-specific goal and is therefore not applicable.
Reduce emissions from local oil and gas extraction	BE-8	Implement short-term measures to reduce emissions related to oil and gas extraction	Not Applicable. This is not a project-specific goal and is therefore not applicable.
Transportation: Affordable, safe, carbon-free transportation choices connect all Long Beach communities to opportunity, clean air, and improved health			
Decrease reliance on personal motor vehicles and increase transit, biking, and walking trips	T-1	Increase the frequency, connectivity, and safety of transit options	Consistent. The Project would not obstruct or interfere with the City's efforts to decrease reliance on personal motor vehicles and increase transit, biking, and walking trips.
	T-2	Expand and improve pedestrian infrastructure citywide	
	T-3	Increase bikeway infrastructure	
Shift to low- and zero-emissions vehicles to move people and freight	T-4	Implement the Port of Long Beach Clean Trucks Program	Consistent. The Project would not obstruct or interfere with the City's efforts to shift to low- and zero-emissions vehicles to move people and freight.

Objective	No.	Action	Consistency
	T-5	Develop an Electric Vehicle Infrastructure Master Plan	
Prioritize the development of transit-oriented neighborhoods with a mix of jobs, services, and housing	T-6	Increase employment and residential development along primary transit corridors	Consistent. The Project would not obstruct or interfere with the City’s efforts to prioritize the development of transit-oriented neighborhoods with a mix of jobs, services, and housing.
	T-7	Update the Transportation Demand Management Ordinance	
	T-8	Increase density and mixing of land uses	
	T-9	Integrate SB 743 planning with CAAP process	
Waste: Long Beach is a zero-waste city			
Materials that can be recycled are recycled	W-1	Ensure compliance with state law requirements for multi-family and commercial property recycling programs	Not Applicable. This is not a project-specific goal and is therefore not applicable.
	W-2	Develop an organic waste collection program for City-serviced accounts	
Collect all organic waste for composting or clean energy generation	W-3	Partner with private waste haulers to expand organic waste collection community-wide	Not Applicable. This is not a project-specific goal and is therefore not applicable.

Objective	No.	Action	Consistency
	W-4	Identify organic waste management options	

The Project would not conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Construction - Unmitigated) - Los Angeles-South Coast County, Annual

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project area is approximately 6.3 acres

Construction Phase - Construction anticipated to be completed in 2022

Off-road Equipment - Hours are based on an 8-hour workday

Off-road Equipment - Crawler Tractors used in lieu of Tractors/Loaders/Backhoes

Off-road Equipment -

Off-road Equipment - Crawler Tractors used in lieu of Tractors/Loaders/Backhoes

Off-road Equipment -

Off-road Equipment - Crawler Tractors used in lieu of Tractors/Loaders/Backhoes

Trips and VMT - Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for Demolition, Site Preparation, Grading, and Building Construction

Demolition -

Grading - This analysis conservatively assumes that up to 5 acres will be disturbed per day

Architectural Coating - Rule 1113

Vehicle Trips - Construction run only

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - Construction run only

Water And Wastewater - Construction run only

Solid Waste - Construction run only

Construction Off-road Equipment Mitigation - Rule 403

Fleet Mix -

Area Coating -

Consumer Products - Construction only

Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	61.80	1000sqft	1.42	61,798.00	0
User Defined Industrial	125.60	User Defined Unit	0.00	0.00	0
Other Asphalt Surfaces	51.84	1000sqft	1.19	51,836.00	0
Parking Lot	376.00	Space	1.46	58,572.00	0
City Park	0.81	Acre	0.81	35,405.00	0
Unrefrigerated Warehouse-No Rail	61.80	1000sqft	1.42	61,797.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW/hr)	564.66	CH4 Intensity (lb/MW/hr)	0.023	N2O Intensity (lb/MW/hr)	0.005

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Proposed Project Operations) - Los Angeles-South Coast County, Annual

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project site is approximately 6.3 acres

Construction Phase - Operations run only

Off-road Equipment - Operations run only

Trips and VMT - Operations run only

Vehicle Trips - Trip characteristics based on information provided in the Traffic Assessment

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - The Project will design building shells and building components to meet 2019 Title 24 Standards which expects 30% less energy for nonresidential uses

Operational Off-Road Equipment - Based on SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results (2014)

Fleet Mix - Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY). Truck Mix based on information in the Traffic Analysis

Area Coating -

Water And Wastewater -

Solid Waste -

San Francisco Avenue (Currently Approved Operations) - Los Angeles-South Coast County, Annual

San Francisco Avenue (Currently Approved Operations)
Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	137.43	1000sqft	3.16	137,432.00	0
User Defined Industrial	137.43	User Defined Unit	0.00	0.00	0
Other Asphalt Surfaces	3.14	Acre	3.14	136,778.40	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	9			Operational Year	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	564.66	CH4 Intensity (lb/MWhr)	0.023	N2O Intensity (lb/MWhr)	0.005

1.3 User Entered Comments & Non-Default Data

San Francisco Avenue (Currently Approved Operations) - Los Angeles-South Coast County, Annual

Project Characteristics - Intensity factors adjusted to reflect the RPS for the 2022 Opening Year

Land Use - Total Project area is approximately 6.3 acres

Construction Phase - Operations run only

Off-road Equipment - Operations run only

Trips and VMT - Operations run only

Vehicle Trips - Trip characteristics based on information provided in the Traffic Assessment

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - The Project will design building shells and building components to meet 2019 Title 24 Standards which expects 30% less energy for nonresidential uses

Operational Off-Road Equipment - Based on SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results (2014)

Fleet Mix - Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY). Truck Mix based on information in the Traffic Analysis

1 Source: California Air Resources Board. EMFAC2017 Web Database. <https://www.arb.ca.gov/emfac/2017/>; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Los Angeles (SC) region.

3 Because EMFAC2017 provides vehicle trips data for MHD and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_x STREX emission rates are utilized.

This Phase I Environmental Site Assessment Report for the Property located at 1401 San Francisco Avenue and 929 West Anaheim Street in Long Beach, California, dated May 29, 2020, was prepared by Tyler Watkins and reviewed by Justin Rauzon and Ashley Hutchens.

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312. The resumes for the individuals below are included in **Appendix G**. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

EXECUTIVE SUMMARY

SCS Engineers (SCS) was retained by 929 Anaheim LLC to prepare a Phase I Environmental Site Assessment (Phase I ESA) of property located at 1401 San Francisco Avenue and 929 West Anaheim Street, Long Beach, California (the “Property”). This assessment was performed in conformance with 40 CFR 312, Standards for Conducting All Appropriate Inquiries, and in general conformance with ASTM E1527-13.

The Property is located on the west side of San Francisco Avenue, between West 15th Street and West Anaheim Street. It is approximately 6.66 acres and is currently occupied by the Petros Tubular (Petros) storage yard. The Petros storage yard consists of a small, approximately 5,600-square-foot warehouse/office building and outdoor material storage areas. A paved lot with a small portable “break room” trailer is located on the southern portion of the Property, which Petros uses mainly for truck parking.

The Property was vacant land in the late 1890s and early 1900s. By 1923, at least three buildings were present on the Property. Historical sources indicate that City of Long Beach municipal service buildings (garage, carpenter shop, storeroom, etc.) were constructed on the northern portion of the Property in the 1920s and 1930s. The southern portion of the Property was developed as a private lumberyard in the 1930s. By 1947, a road (an extension of West 14th Street) crossed the center of the Property, dividing it into two sections, with numerous commercial buildings on both the northern and southern portions. The 1950 Sanborn map identified the Long Beach City Yard and City of Long Beach Public Service Department as the occupants of the northern portion of the Property. Building uses included storage, labs, warehouses, woodworking and plumbing, a carpenter shop, and a paint shop. Fickling Lumber Company and an animal hospital occupied the southern portion of the Property, to the south of West 14th Street. Building uses included lumber storage, building materials warehouses, a planing mill, and kennels. David Roofing Company and Standard Stations Inc. Wilmington were listed as additional occupants of the southern portion of the Property (929 West Anaheim Street). By 1963, a paint shop and metal spray booth was present at the City yard on the northern side of the Property. By 1989, the lumberyard buildings located on the southern portion of the Property were removed and replaced with truck and vehicle parking. By 2012, most of the buildings previously located on the Property were removed, and the Property appeared to be in its present day configuration.

The site reconnaissance did not identify any recognized environmental conditions (RECs) associated with the current Petros operations at the Property. A city-owned parcel with a lead-impacted soil stockpile covered with vegetation adjoins the northern portion of the Property immediately to the west. Visual observation of this stockpile identified that a final cap does not appear to have been installed. The area, separated from the Property by privacy fencing, was partially overgrown with weeds and brush that would typically prevent aerial migration onto the Property during wind events. During the site inspection, SCS was informed that a small fire occurred on the stockpile in the past month. The western half of the stockpile appeared burned, and some of the foliage that had grown atop the stockpile was no longer present. The lead-impacted soil pile is considered a Business Environmental risk (BER).

Numerous potential environmental concerns were identified during previous Phase I ESAs, including fill material containing debris from the 1933 earthquake, underground storage tanks (USTs), clarifiers, paint and solvent storage, parts cleaning, former pesticide storage, identification of a potential gas station, and waste oil storage. SCS has conducted several investigations and overseen remedial excavation of soil at the Property. Based on the results of these investigations, the Long Beach Department of Human Health Services (DHHS) and/or the Los Angeles Regional Water Quality

Control Board (RWQCB) have issued several No Further Action (NFA) letters. No significant evidence of releases of hazardous substances from some areas of concern investigated; so these areas are considered historical recognized environmental conditions (HRECs). Former USTs removed from the Property that received NFA closure allowed residual contamination to remain in place, so these areas are considered controlled recognized environmental conditions (CRECs). Earthquake debris and associated lead-impacted soil was excavated from much of the Property during remediation activities in 2014 and 2015. Some residual lead-impacted debris remains in place, including beneath the building, along the western Property line, and beneath a Southern California Edison electrical pole. Since DHHS has issued an NFA letter for the residual contamination in place, while left undisturbed it is considered a CREC. In light of planned redevelopment activities that may disturb this soil during grading, however, it constitutes a REC.

Observations during the site inspection indicate that adjacent properties are currently occupied by numerous commercial/industrial operators. No obvious RECs for the Property were identified on these adjacent sites. However, regulatory database information also indicates that numerous sites within 0.25 miles of the Property have had releases of substances including hydrocarbons and volatile organic compounds (VOCs), and groundwater in the area has been impacted. Based on this information, it is possible that impacted groundwater from these sites has migrated beneath the Property. Since plans call for the Property to be redeveloped with a continued commercial/industrial use, SCS recommends that lead-impacted material be segregated and removed from the Property.

Conclusions

In summary, SCS performed a Phase I Environmental Site Assessment of the Property located at 1601 San Francisco, Long Beach, California, in conformance with the scope and limitations of 40 CFR 312 and ASTM E1527-13. Any exceptions to, or deletions from, this practice are described in Section 5 of this report.

In the opinion of the Environmental Professionals, this assessment has revealed evidence of a condition indicative of a recognized environmental condition in connection with the Property, as discussed above. A soil management plan (SMP) should be prepared for management of any debris- and/or lead-impacted soil that may be encountered during planned re-development activities.

Data Gaps

Environmental records requests from the Long Beach Fire Department (LBFD) and RWQCB were not returned as of the time of this report. Based on the previous site investigations performed, this does not constitute a significant data gap.

1 INTRODUCTION

SCS Engineers (SCS) was retained by 929 Anaheim LLC (the “User”) to prepare a Phase I Environmental Site Assessment (Phase I ESA) of the property located at 1401 San Francisco Avenue and 929 West Anaheim Street, Long Beach, California (the “Property”). Petros Tubular Services, Inc. (Petros) currently leases the Property. A location map for the Property is presented as **Figure 1** in **Appendix A**. This assessment was performed in conformance with 40 CFR 312, Standards for Conducting All Appropriate Inquiries (AAI), and in general conformance with ASTM E1527-13.

2 PURPOSE

This Phase I ESA is intended to constitute appropriate inquiry into the previous ownership and uses of the Property, as required to support the assertion of the innocent landowner, contiguous property owner, and/or bona fide prospective purchaser defenses to liability (collectively the landowner liability protections, or LLPs) under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA a.k.a. Superfund), as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA), and the Small Business Liability Relief and Brownfields Revitalization Act of 2002.

The purpose of this investigation was to identify conditions indicative of releases or threatened releases of hazardous substances as defined in CERCLA Section 101, and petroleum products, on, at, in, or to the Property.

If known or suspected contamination is identified, Users seeking to maintain LLPs have responsibilities in addition to completion of an AAI-compliant Phase I ESA. These “continuing obligations” include taking “appropriate care” and “reasonable steps” with respect to known or suspected releases of hazardous substances during the term of property ownership. In addition to these requirements under federal law, there are different requirements under state law with respect to liability protections. On request, SCS can provide support for clients with continuing obligations, as appropriate.

3 SCOPE OF SERVICES

This Phase I ESA is based on:

- Interviews with past and/or present owners, operators, and/or occupants of the Property.
- Reviews of federal, tribal, state, and local government records.
- Visual inspections of the Property and adjoining sites performed on May 11, 2020 and May 13, 2020.
- Review of historical Property use information (topographic maps, aerial photographs, fire insurance maps, existing reports, etc.).
- Commonly known or reasonably ascertainable information about the Property (e.g., interviews with appropriate regulatory agency personnel and review of agency files review of available documents, interviews with other knowledgeable persons).
- Degree of obviousness of the presence or likely presence of contamination at the Property, and the ability to detect the contamination by appropriate investigation.
- Information provided as a result of the additional inquiries conducted by the User.

4 SPECIAL TERMS AND CONDITIONS

This Phase I ESA for the Property located at 1401 San Francisco Avenue and 929 West Anaheim Street, Long Beach, California, has been prepared specifically for 929 Anaheim LLC [Abstract]. The report has been prepared in accordance with the care and skill generally exercised by reputable professionals, under similar circumstances, in this or similar localities. No other warranty, express or implied, is made as to the professional opinions presented herein.

No other party, known or unknown to SCS, is intended as a beneficiary of this work product, its content, or information embedded therein. Third parties use this report at their own risk. Third party reliance letters may be issued on request to SCS subject to approval of 929 Anaheim LLC [Abstract] and payment to SCS of a fee for such letters.

5 LIMITATIONS AND ASSUMPTIONS

The investigation focuses on releases and threatened releases of hazardous substances or petroleum products that could be considered a recognized environmental condition (REC) and/or a liability due to their possible presence in significant concentrations (e.g., above acceptable limits set by the federal or state government) or due to the potential for contaminant migration through exposure pathways (e.g., soil vapor migration or groundwater ingestion). Materials that may contain substances which are not currently deemed hazardous by the U.S. Environmental Protection Agency (EPA) or California Environmental Protection Agency (CalEPA) were not considered as part of this study.

Unless specifically included in our scope of services, formal surveys for asbestos-containing materials, lead-based paints, fire safety, vapor intrusion, indoor air quality, mold, and similar matters were not part of this assessment. The Property was not evaluated for compliance with land use, zoning, wetlands, or similar laws. This report is not intended to be an environmental compliance audit.

Hazardous substances naturally occurring in plants, soils, and rocks (e.g., heavy metals, naturally occurring asbestos, or radon) are not typically considered in these investigations. Similarly, construction debris (e.g., discarded concrete, asphalt, etc.) is not considered to be of concern unless observations suggest that hazardous substances are likely to be present in significant concentrations.

Unless otherwise noted, sampling and laboratory analyses of soil, water, air, building materials, or other media, were not performed as part of this investigation. Positive identification of hazardous substances can only be accomplished through sampling and appropriate laboratory analysis.

SCS Engineers assumes no responsibility for the accuracy of information obtained from, compiled by, or provided by third-party sources, such as regulatory agency listings. Unless obviously inaccurate or if information exists to the contrary, SCS Engineers assumes that information collected during this environmental site assessment is accurate and correct. Unless warranted, information collected has not been independently validated as part of this assessment.

The following information is the responsibility of the User (40 CFR 312.22) and is not included in this Phase I ESA:

- Specialized knowledge or experience of the User.

- The relationship of the purchase price to the fair market value of the Property. The purchaser of a Property is required to consider whether any differential between the purchase price and the fair market value of the Property is due to the presence of releases or potential releases of hazardous substances at the Property.

Certain other limitations could affect the accuracy and completeness of this report, as follows:

- Site Access Limitations – None.
- Physical Obstructions to Observations – None.
- Outstanding Information Requests – Some regulatory agency records requests were not returned as of the date of this report. Based on the other information reviewed, this does not represent a significant data gap.
- Historical Data Sources Failure – None.
- Other Limitations – None.

6 GENERAL SITE CHARACTERISTICS

SITE LOCATION

The Property is located on the west side of San Francisco Avenue, between West 15th Street and West Anaheim Street. It is currently assigned Assessor Parcel Numbers (APNs) 7271-008-014, 7271-008-016, and 7271-007-005. Historical APNs for the Property include 7271-008-013 and -900, and 7271-117-092. A current APN map is provided as **Figure 2** in **Appendix A**. Historical APNs are designated on **Figure 3**.

GENERAL SITE DESCRIPTION

The Property is approximately 6.66 acres and is currently occupied by a Petros storage yard. The Petros facility consists of a small, approximately 5,600-square-foot warehouse/office building and outdoor storage areas. A paved lot with a small portable trailer is located on the southern portion of the Property. Petros uses this southern paved lot mainly for truck parking.

ADJOINING PROPERTY USE

Adjacent properties consist of the following:

- North – A vacant storage yard adjoins the Property to the north (1601 San Francisco Avenue).
- South – West Anaheim Street adjoins the Property to the south. A large warehouse, occupied by Air Products & Chemicals Inc., is located south of West Anaheim Street (901 West 12th Street). De Forest Avenue, which runs north-south, terminates at the intersection with West Anaheim Street immediately south of the Property.
- East – San Francisco Avenue adjoins the Property to the east. Commercial/Industrial business, including Ready Storage (800 West 15th Street); G&J Forklift Sales (899 West Cowles Street); Food Bank of Southern California (1444 San Francisco Avenue); and Harbor Custom Canvas (733 West Anaheim Street) are located east of San Francisco Avenue.

- West – A city-owned parcel with a soil stockpile covered with vegetation adjoins the northern portion of the Property immediately to the west. The Los Angeles River and associated river trail adjoin the rest of the Property to the west. A freeway on/off ramp is located on the west side of the Los Angeles River. Multiple oil wells and oil-related industrial activities are located on an industrial site between the Los Angeles River and the freeway.

7 PHYSICAL SETTING

PHYSIOGRAPHIC SETTING

According to the U.S. Geological Survey (USGS), Long Beach (1964, photorevised 1981), California 7.5-minute topographic map, the Property is located immediately east of the Los Angeles River at an elevation of approximately 5 feet above mean sea level and about 1.3 miles north of San Pedro Bay. Regional topography is relatively flat with a gentle slope to the west.

GEOLOGY AND SOILS

Geologic maps indicate that surface sediments in the area are Quaternary alluvium and coastal deposits of silt, sand, and gravel that are underlain by the late Pleistocene Lakewood Formation. The Lakewood Formation, which consists of gravel, sand, sandy silt, silt and clay with shale pebbles, extends to a depth of approximately 100 feet (California DWR, Bulletin No.104). Sediments below the Lakewood Formation belong to the late Pleistocene San Pedro Formation.

GROUNDWATER

The Property is located in the southern portion of the West Coast Groundwater Basin. The first groundwater aquifer in the region is within the Gage Aquifer within the Lakewood Formation. Based on groundwater monitoring reports for a former underground storage tank (UST) site located in the 14th Street right-of-way on the Property (SCS, April 2010), first groundwater is approximately 4 to 5 feet below ground surface (bgs) and flows southeasterly in direction. Shallow groundwater has locally been impacted by saltwater intrusion; therefore, it is not used as a drinking water source. Tidal influence from the adjacent Los Angeles River may influence groundwater elevation beneath the Property. Groundwater in the area of the former 14th Street right-of-way UST site has been impacted by gasoline-related constituents.

RADON

According to the California Department of Public Health's February 2016 Radon Program report, screening in the area of the Property (90813 zip code) found no locations (out of 8) where buildings had radon levels greater than or equal to 4 picocuries per liter (pCi/L), the EPA action level. The maximum radon result for the Property's zip code was 0.4 pCi/L. The alluvial geology of the Long Beach area is not normally associated with elevated radon levels. Note that elevated radon levels may also be attributed to other radon sources such as leaking natural gas or numerous building products such as drywall, cinderblock, concrete floors, brick, or stone products. Based on the available information, therefore, elevated radon gas is not expected in the area of the Property.

8 SITE INSPECTION

Tyler Watkins of SCS conducted an inspection of the Property and surrounding area on May 11 and May 13, 2020. An aerial photo and photographs of the Property are provided in **Appendix B**.

Access to the Property was provided by Mr. Fernando Gonzalez, of Petros. Petros is a tubular and drill pipe inspection/reclamation company that services the oil industry. One concrete building containing material storage and office spaces is located on the northern portion of the Property. The remaining Property area is occupied by an asphalt paved storage yard. Petros stores pipes, valves, electrical equipment, etc. In some areas, the surface of the asphalt pavement appeared lightly stained from forklift or truck leaks. This staining was *de minimis* in nature. The southern portion of the Property contains a paved lot with a small “break room” trailer in the southeastern corner. Petros uses this southern area mainly for truck storage.

HAZARDOUS SUBSTANCES

A hazardous materials storage area was located on the northeastern portion of the Property. A drum of diesel fuel in secondary containment and various small containers of hydraulic oil were observed in the storage area. No evidence of spills or releases from the storage area were observed. Various containers of paint, motor oil, and paint thinner were observed on the southern portion of the Property. No evidence of spills or releases were observed from these containers.

NATURAL DRAINAGE

Natural waterways are not currently located on the Property. The Los Angeles River Flood Control Channel is located immediately west of the Property. Storm drains and associated concrete channels were observed across the yard. Runoff from the Property drains to the surface drains and channels and to the surrounding streets or river channel.

DISTURBED AREAS

No obvious disturbed areas were observed. There was no visual evidence of landfilled materials. Landfilled earthquake debris at the Property is discussed further in Section 11.

ELEVATORS AND OTHER HYDRAULIC EQUIPMENT

No elevators or other hydraulic equipment were observed on the Property.

WELLS

No groundwater supply or monitoring wells were observed on the Property. A groundwater well was observed on the sidewalk east of the Property. The use of the well is unknown, however it is not known to be a groundwater monitoring well.

ELECTRICAL EQUIPMENT

One pad-mounted Southern California Edison (SCE) electrical transformer servicing the building was noted on the eastern side of the Property. Four pole-mounted SCE electrical transformers were observed east of the Property, along San Francisco Avenue. SCE has stated that they have never specified the purchase of distribution transformers utilizing PCBs as the insulating/cooling fluid. SCE transformers utilize mineral oil exclusively. In a statistically valid test of over 20,000 SCE distribution transformers, SCE determined that the concentrations of PCBs in the mineral oils was less than 50 parts per million (ppm) in over 96 percent of the units. Based on the available information, no significant environmental impact to the Property is anticipated from these transformers.

WASTEWATER

No industrial wastewater is currently generated at the Property. Domestic sanitary sewage generated on the Property is discharged to the city sanitary sewer system.

DRINKING WATER

Drinking water is supplied to the Property by the City of Long Beach. All large public water suppliers in California have been required to test their water and comply with federal and state drinking water standards since the mid-1980s. Consequently, lead and other contaminants of concern are not expected to be present above applicable primary and secondary drinking water standards.

STORAGE TANKS

No evidence (fill ports, vent lines, or dispensers) of current USTs was observed on the Property. A historical UST removed from the Property is discussed further in Section 11. No aboveground storage tanks (ASTs) were observed on the Property.

VISUAL INSPECTION OF ADJOINING SITES

Other than the presence of a known lead-impacted stockpile adjacent to the northwest, no obvious evidence of a REC or indications of contamination (e.g. remediation equipment, staining, USTs, etc.), was observed on adjoining sites during the site inspection. The origin and purpose of the pile is discussed further in Section 11 of this report. Visual observation of this stockpile identified that a final cap does not appear to have been installed. The area, separated from the Property by privacy fencing, was partially overgrown with weeds and brush that would typically prevent aerial migration onto the Property during wind events. During the site inspection, SCS was informed that a small fire occurred on the stockpile in the past month. The western half of the stockpile appeared burned, and some of the foliage that had grown atop the stockpile was no longer present. The lead-impacted soil pile, without an appropriate cap, but covered with brush as it currently exists, is considered a Business Environmental risk (BER).

9 INTERVIEWS

Mr. Fernando Gonzalez, of Petros, was interviewed during the site inspection. Mr. Gonzalez informed SCS of the recent fire on the lead-impacted stockpile. Mr. Gonzalez was unaware of any potential environmental issues at the Property, with the exception of the landfilled earthquake materials located immediately west of the Property and further discussed below in Section 11.

10 SITE HISTORY

Site history was evaluated from the following sources:

- Historical U.S. Geological Survey (USGS) topographic maps provided by Environmental Data Resources (EDR) (April 29, 2020).
- Historical aerial photographs provided by EDR (April 30, 2020).
- Sanborn Fire Insurance maps obtained from the EDR-Sanborn collection (April 30, 2020).
- City of Long Beach Department of Building and Safety building permit information.
- A City Directory review report provided by EDR (April 30, 2020).

Copies of topographic maps, historical aerial photographs, city directories, and Sanborn maps are included in **Appendix C**.

Year	Description	Source
1896, 1899, and 1902	The Property and surrounding area was vacant or undeveloped land. Rivers were located to the east and the west of the Property.	Topographic maps
1923	At least three buildings were located on the Property. The buildings appeared to be commercial use. Unpaved road or trails were also located on the Property. Vacant land was located immediately to the west of the northern portion of the Property. The Los Angeles River was located to the west of the Property. Vacant land was located on the western side of the river. Vacant land with unpaved roads or trails was located to the north of the Property. A residential or agricultural building was located on a large lot east of the Property. Multiple unpaved roads or trails crossed the large lot. West Anaheim Street was located immediately south of the Property. A rectangular building was located on the south side of West Anaheim Street. Railroad tracks were present on the eastern side of the rectangular building.	Topographic map and Aerial photograph
1925	No significant changes from the 1923 topographic map were noted on the Property. Railroad tracks were present on both sides of the Los Angeles River, west of the Property.	Topographic map
1928	Multiple buildings were located on the Property. At least three buildings were constructed immediately west of the northern portion of the Property. Various commercial or industrial buildings were depicted west of the Los Angeles River. A gated animal pen was depicted on the large lot east of the Property.	Aerial photograph
1929	A building permit was issued for alterations to a municipal garage (1401 San Francisco Avenue).	Building permits
1931	City Garage was listed as the occupant of the northern portion of the Property (1401 San Francisco Avenue).	City directory
1932	A building permit was issued to construct a carpenter shop and store room for the City of Long Beach (1401 San Francisco Avenue).	Building permits
1935 and 1938	Building permits for the construction of a lumber storage shed and additions to covered driveways were issued to A.E. Fickling for Property address 929 West Anaheim Street.	Building permits

Year	Description	Source
1942	The railroad tracks previously located west of the Property (on the east side of the Los Angeles River) were no longer present.	Topographic map
1943	An additional building was depicted south of the Property, across West Anaheim Street.	Topographic map
1947	The Property was divided into two sections, separated by a street. The northern portion of the Property was occupied by at least eight commercial buildings. The southern portion of the Property was occupied by at least three buildings. Industrial development was present to the west of the Property, beyond the Los Angeles River, and to the north of the Property.	Topographic map and Aerial photograph
1948	A.E. Fickling Lumber Company was listed as the occupant of the southern portion of the Property (929 West Anaheim Street).	City directory
1949	Four buildings were depicted on the east side of the northern portion of the Property. Five buildings were depicted on the southern portion of the Property. Two buildings were located to the west of the northern portion of the Property, between the Property and the Los Angeles River.	Topographic map
1950	The northern portion of the Property was occupied by the Long Beach City Yard and City of Long Beach Public Service Department. Building uses included storage, labs, warehouses, woodworking and plumbing, a carpenter, and a paint shop. West 14 th Street separated the northern portion of the Property from the southern portion. The southern portion of the Property was occupied by the Fickling Lumber Company and an animal hospital. Building uses included lumber storage, building materials warehouses, a planing mill, and kennels. David Roofing Company and Standard Stations Inc. Wilmington were listed as additional occupants of the southern portion of the Property (929 West Anaheim Street). The City Animal Shelter was located to the west of the northern portion of the Property. Buildings at the shelter included offices, kennels, and gas chambers. The Los Angeles County Flood Control Channel was located to the west of the Property. A vacant building and automobile garage were located to the south of the Property. Truck parking and the Adohr Milk Farm garage and truck repair area were located to the east of the northern portion of the Property.	Sanborn map

Year	Description	Source
1951	A building permit was issued for the construction of lumber storage on the southern portion of the Property (929 West Anaheim Street).	City directory
1952	AE Fickling Lumber Company was listed as the sole occupant of the southern portion of the Property (929 West Anaheim Street). The City Public Service Department was listed as the occupant of the adjoining site to the north of the Property (1601 San Francisco Avenue).	City directory
1953	The northern portion of the Property appeared relatively unchanged from the layout depicted in the 1950 Sanborn map. A street was constructed east of the southern portion of the Property, and vacant land was present to the east of the street. A building permit was issued for the construction of lumber storage on the southern portion of the Property (929 West Anaheim Street). Industrial development was present to the north and east of the Property. The agricultural or residential building previously located to the east of the southern portion of the Property was no longer depicted, and the land was mainly vacant, with some vehicle parking present. A large industrial warehouse and paved parking area were present to the south of the Property. A freeway was constructed west of the Los Angeles River, and industrial development was present west of the freeway.	Aerial photograph and Building permits
1954	Rays Vacuum Truck Service and Routh Transportation are listed as the occupants of one of the adjoining sites to the east of the Property (800 West 15 th Street).	City directory
1957	The Long Beach City Health Department and City Public Service Department were listed as the occupants of the adjoining site to the north of the Property (1601 San Francisco Avenue). Youngs Market Company liquors and Kuster Electrical Company construction yard occupied two of the adjoining sites to the east of the Property (899 West Cowles and 801 West 14th Street).	City directory
1960	Diamond Cab Company and Yellow Cab Company were listed as the occupants of one of the adjoining sites to the east of the Property (1444 San Francisco Avenue).	City directory

Year	Description	Source
1963	The northern portion of the Property was occupied by a portion of the Long Beach City Yard and City of Long Beach Public Service Department. Building uses included parking garages, a paint shop with metal spray booth, laboratory, carpentry, warehouses, storage areas, sheds, and woodworking and plumbing. The southern portion of the Property was occupied by the A.E. Fickling Lumber Company. Building uses included lumber storage, a mill, and building materials storage. The street located on the west side of the southern portion of the Property was labeled De Forest Avenue. Amundsen Delman was listed as an additional occupant of the southern portion of the Property (929 West Anaheim Street). The remainder of the Long Beach City Yard was located to the west of the northern portion of the Property. Building uses included offices and storage areas. A liquor warehouse and private garage were located to the east of the Property.	Aerial photograph, City directory, and Sanborn map
1964	Site-specific details were not provided on the 1964 topographic map. No significant changes from the 1949 topographic map were noted on the Property or surrounding areas. Yellow Cab Gardena and Market Bench Company were listed as the occupants of one of the adjoining sites to the east (1444 San Francisco Avenue). Pameco-Aire was listed as the occupant of 733 West Cowles Street, located east of the Property.	Topographic map and City directory
1969	San Francisco Avenue Inc. Auto was listed as an additional occupant of 1444 San Francisco Avenue, located east of the Property.	City directory
1972	The smaller storage buildings previously located on the southern portion of the Property were replaced with a larger building. Industrial warehouses were present to the east of the southern portion of the Property.	Topographic map and Aerial photograph
1975	Mayes Kyle O Co. Inc. Trucking (800 West 15 th Street), Lawnee Inc (899 West Cowles), Technical Service Company (801 West 14 th Street), South Pac Canning Co, South Coast Fisheries Co, and The Halfhill Co (806 West 14 th Street) were listed as the occupants of the adjoining sites to the east of the Property.	City directory
1976	Three buildings and some material storage were located on the southern portion of the Property.	Aerial photograph

Year	Description	Source
1980	Medi Diamond, Long Beach Special Services, Dollar Ride, Diamond Cab Company, Bellflower City of Dollar Ride, Long Beach Airport Transportation, and Yellow Cab Company were listed as the occupants of one of the adjoining sites to the east of the Property (1444 San Francisco Avenue).	City directory
1981	Site-specific details were not provided on the 1981 topographic map. No significant changes from the 1964 topographic map were noted on the Property or surrounding areas.	Topographic map
1985	Long Beach Food Bank (1444 San Francisco Avenue), Magtrol Electrical Supplies (806 West 14 th Street), and Chancellor & Ogden Inc. (800 West 15 th Street) were listed as some of the occupants of adjoining sites to the east.	City directory
1989	The buildings previously located on the southern portion of the Property were no longer present, and were replaced by vehicle parking. The streets previously located on the Property were no longer used as through-streets. A storage unit center was located to the east of the northern portion of the Property, and additional warehouses were constructed to the east of the southern portion of the Property.	Aerial photograph
1991	Ready Storage (800 West 15 th Street), Second Harvest Food Bank of Greater South Bay (1444 San Francisco Avenue), and Harty Building Inc./Seven Strand Tackie Corp. (899 West Cowles) were listed as some of the occupants of the adjoining sites to the east of the Property.	City directory
1994	Some of the buildings located on the northern portion of the Property were no longer present. Long Beach Storm Drains, Long Beach Maintenance, Long Beach Trees, and Long Beach Public Services Bureau were listed as the occupants of the adjoining site to the north of the Property (1601 San Francisco Avenue). Food Bank of Southern California (1444 San Francisco Avenue) and Gold Food Service (806 West 14 th Street) were listed as some of the occupants of adjoining sites to the east of the Property.	Aerial photograph and City directory
1999	Various City of Long Beach departments were listed as the occupants of the adjoining site to the north (1601 San Francisco Avenue). Atlantic Steamers Supply Company (899 West Cowles), The Hawaiian Connection (1444 San Francisco Avenue), Everetts Automotive (806 West 14 th Street), and Hill Ammunition Corporation (733 West Anaheim Street) were listed as occupants of adjoining sites to the east of the Property.	City directory

Year	Description	Source
2002	An industrial building and parking area was constructed on the southern portion of the Property. An industrial area was present to the west of the Property, across the Los Angeles River.	Aerial photograph
2004	Gulf Marine & Industrial Supplies Inc., Poseidonia Ship Supply, and Jason Gaines were listed as additional occupants of 899 West Cowles Street, located east of the Property. Hydraulic Automation Control Inc. was listed as the occupant of 806 West 14 th Street, located east of the Property.	City directory
2005 and 2009	No significant changes from the 2002 aerial photograph were noted on the Property or surrounding areas.	Aerial photograph
2012	All of the buildings on the southern portion of the Property and several of the buildings on the northern portion of the Property were no longer present. The structures previously located to the west of the northern portion of the Property were removed, and the sites located to the west and north of the Property were used for material storage.	Topographic map and Aerial photograph
2014	G&J Forklift Inc. was listed as the occupant of 899 West Cowles Street, located east of the Property.	City directory
2016	The Property was used as a storage yard. One building was present on the northern portion of the Property. Vacant, overgrown land was present to the west of the northern portion of the Property. No significant changes from the 2012 aerial photograph were noted on the adjoining sites to the north, east, and south of the Property.	Aerial photograph

HISTORICAL USE SUMMARY

The Property was vacant land in the late 1890s and early 1900s. By 1923, at least three buildings were present on the Property. Historical sources indicate that City of Long Beach municipal service buildings (garage, carpenter shop, storeroom, etc.) were constructed on the northern portion of the Property in the 1920s and 1930s. The southern portion of the Property was developed as a private lumberyard in the 1930s. By 1947, a road (an extension of West 14th Street) crossed the center of the Property, dividing it into two sections, with numerous commercial buildings on both the northern and southern portions. The 1950 Sanborn map identified the Long Beach City Yard and City of Long Beach Public Service Department as the occupants of the northern portion of the Property. Building uses included storage, labs, warehouses, woodworking and plumbing, a carpenter shop, and a paint shop. Fickling Lumber Company and an animal hospital occupied the southern portion of the Property, to the south of West 14th Street. Building uses included lumber storage, building materials warehouses, a planing mill, and kennels. David Roofing Company and Standard Stations Inc. Wilmington were listed as additional occupants of the southern portion of the Property (929 West Anaheim Street). By 1963, a paint shop and metal spray booth was present at the City yard on the

northern side of the Property. By 1989, the lumberyard buildings located on the southern portion of the Property were removed and replaced with truck and vehicle parking. By 2012, most of the buildings previously located on the Property were removed, and the Property appeared to be in its present day configuration.

Historical uses of the Property, particularly the presence of a paint shop and metal spray booth on the northern portion of the Property, are commonly associated with elevated environmental risk. Previous environmental investigations of these areas of concern are discussed in Section 11.

HISTORICAL USE OF ADJOINING SITES

The adjoining sites were predominantly vacant land from at least 1896 through the early 1920s, when commercial buildings were constructed to the south and east of the Property. Tenants at adjoining sites have included storage centers, forklift repair, food banks, marine supplies, automotive repair, City of Long Beach Services, and cab companies.

11 COMMONLY KNOWN OR REASONABLY ASCERTAINABLE INFORMATION

In order to identify commonly known or reasonably ascertainable information about the Property, SCS reviewed previous environmental reports and various regulatory agency files and interviewed regulatory agency personnel. The following information was identified.

PREVIOUS ENVIRONMENTAL REPORTS

The following reports have been prepared and/or reviewed by SCS:

- SCS Engineers, February 22, 2005. *Phase I Environmental Assessment, Long Beach Public Service Yard, San Francisco Avenue – 7 APNs, Long Beach, California*, (File No. 01204007.01)
- SCS Engineers, August 2, 2005. *Phase II Site Investigation Report, Long Beach Public Service Yard, 1601 San Francisco Avenue, Long Beach, California*, (File No. 01204007.02).
- SCS Engineers, October 17, 2005. *Groundwater Investigation Report, Former Long Beach City Tow Yard, 901 West Anaheim (APN 7271-007-902), Long Beach, California (LARWQCB NO. 908130498)*, (File No. 01204007.02).
- SCS Engineers, April 17, 2006. *First Quarter 2006 Groundwater Monitoring, 901 West Anaheim, Long Beach, California*, (File No. 01204007.03).
- SCS Engineers, July 18, 2006. *Second Quarter 2006 Groundwater Monitoring, 901 West Anaheim, Long Beach, California*, (File No. 01204007.03).
- SCS Engineers, October 16, 2006. *Third Quarter 2006 Groundwater Monitoring, 901 West Anaheim, Long Beach, California*, (File No. 01204007.03). Pacific Coast Tank, July 1, 2008. *Underground Storage Tank Removal Report*.
- SCS Engineers, April 2010. *Groundwater Monitoring Report, Former Long Beach City Tow Yard, 901 West Anaheim, Long Beach, California*, (File No. 01209295.00).

- SCS Engineers, November 5, 2010. *Phase I Environmental Assessment, Former Long Beach Public Service Yard, 5½ Parcels at Anaheim Street and San Francisco Avenue, Long Beach, California*, (File No. 01210161.00).
- SCS Engineers, December 1, 2010. *Phase II Investigation Report, Former Long Beach Public Service Yard, 949 W. Anaheim Street, Long Beach, California 90813 (APN 7172-007-903)* (File No. 01210161.01).
- SCS Engineers, February 2, 2011. *Second Semiannual 2010 Groundwater Monitoring Report, Former Long Beach City Tow Yard, 901 West Anaheim, Long Beach, California*, (File No. 01209295.00).
- SCS Engineers, August 9, 2011. *Report of Closure Activities – Former Long Beach City Tow Yard, 901 West Anaheim Street, Long Beach, California* (File No. 01209295.00).
- SCS Engineers, March 2, 2012. *Confirmation Sampling Report, Former Long Beach Public Service Yard, APNs 7271-007-005 and 7271-012-023, Long Beach, California* (File No. 01210161.05).
- SCS Engineers, July 18, 2012. *Summary Report Related to a Geophysical Survey at 949 West Anaheim Street and “Suspect” Wells at 1601 San Francisco Avenue, Long Beach, California* (File No. 01210161.07).
- SCS Engineers, February 2013. *Clarifier Removal Report, Former Long Beach Public Service Yard, 1725 San Francisco Avenue, Long Beach, California* (File No. 01212361.00).
- SCS Engineers, May 9, 2013. *Draft Summary of Site Characterization Activities and Analytical Data Letter, Former Long Beach Public Service Yard, 1725 San Francisco Avenue, Long Beach, California* (File No 01212361.00).
- SCS Engineers, March 2012, Revised May 2014. *Revised Remedial Action Plan, Former Long Beach Public Service Yard (APNs 7271-011-008 and 7271-008-013), Long Beach, California* (File No. 01210161.09).
- SCS Engineers, October 6, 2014. *Letter Re: Submittal of Proposed CAP detail and Schedule, Former Long Beach Public Service Yard (APNs 7271-011-008 and 7271-008-013), Long Beach, California* (File No. 01210161.10).
- SCS Engineers, March 23, 2015. *Site Remediation and Closure Report, “Yard Parcel” of the Former Long Beach Public Service Yard (APNs a portion of 7271-011-008 and 7271-008-013, Long Beach, California* (File No. 01210161.10).
- SCS Engineers, July 13, 2015. *Phase I Environmental Site Assessment, Former Long Beach Public Service Yard, 5 ½ Parcels at Anaheim Street and San Francisco Avenue, Long Beach, California 90813* (File No. 01210161.11).

Numerous investigations, listed above (included in **Appendix D**), have been conducted by SCS on the Long Beach Public Service Yard (LBPSY), which was historically located on the northern portion of the Property and adjoining parcels to the north. It should be noted that the address of 1725 San Francisco Avenue has been used for operations (i.e. UST and clarifier removals and potentially other

waste disposal) throughout the LBPSY, including portions of the Property covered by this assessment. Addresses of 1401 San Francisco and 901, 929, and 949 West Anaheim Street have been associated with various activities at the Property. In addition, please note that the APNs associated with the Property have changed over the years.

Summary of Previous Investigations

In 2005, SCS conducted a Phase I ESA of seven parcels utilized for various operations performed by Long Beach Public Services (e.g. traffic management, street maintenance, and landscaping). The southernmost three parcels included in the 2005 assessment encompassed the Property (at that time the APNs for the Property included 7271-007-902, 7271-008-900, and a portion of 7271-011-900), which were still occupied by public works operations. SCS interviewed public works staff with extensive knowledge of the Property history. In 2010, SCS conducted a Phase I ESA of five and a half of the above parcels included in the 2005 assessment (at this time the APNs for the Property were designated 7271-007-903, 7271-008-901, and a portion of 7271-011-900). In 2015, SCS conducted a Phase I ESA of the same five and a half parcels during which the southern parcel of the Property did not have an assigned APN and the remainder was designated as APNs 7271-008-013 and the eastern portion of 7271-011-008. The previous Phase I ESAs concluded the following:

- Historical information indicates that portions of the former LBPSY (which extended beyond the Property to the north) were initially developed for commercial use as early as 1926, and have been used for commercial or industrial purposes since that time. Historical information identified that two previous occupants of the Property as Superior Laundry at 1317 San Francisco Avenue in 1926, and a gas station at 949 West Anaheim from at least 1931 through 1935.
- In 2015, the Property was occupied by Petros as a storage yard (the “Petros Yard”). The Petros yard stored pipes and fittings associated with the oil and gas industry, similar to current use.
- The area was previously utilized for various operations performed by Long Beach public service departments (e.g. traffic management, street maintenance, plumbing, and landscaping) and was occupied by numerous buildings and storage sheds. Historical operations at the LBPSY considered to be of environmental concern included a carwash, two clarifiers, paint spray booth, former fueling station, fill material containing debris from the 1933 earthquake, and petroleum-related impacts to soil and/or groundwater from USTs. Although these features were previously identified in available historical documents during previous assessments, the available historical information provided for this assessment did not identify the carwash or former fueling station on the Property. Further, historic operations on the Property have included vehicle and equipment maintenance, hazardous waste storage, painting shop, chemical laboratory, landscaping departments, machine shop, etc. The locations and nature of these operations appeared to be transitory, and it was determined that there was a potential that waste oils, various pesticides, oils, paint, and solvents were spilled or leaked over the 70 plus years of operation.

However, since the initial Phase I ESA in 2005, historical features have since been removed and numerous phases of investigation and/or remediation have been conducted to investigate the previously identified RECs, the status of which can be summarized as follows:

- o A Phase II investigation (SCS, August 2, 2005), consisting of soil and soil vapor sampling, was conducted to address concerns identified in the 2005 Phase I ESA. Based on the results of this investigation, the previously identified hazardous

materials storage areas, previous use of solvents, and former fueling station were considered historical recognized environmental conditions (HRECs).

- o A 550-gallon gasoline UST was located in the 14th Street right-of-way (APN 7271-008-014, **Figure 3**). The UST was removed on August 30, 1995. A groundwater investigation and subsequent monitoring events were conducted. The Los Angeles Regional Water Quality Control Board (RWQCB) issued a No Further Action (NFA) letter for the 550-gallon UST at the 14th Street right-of-way in a letter dated July 6, 2011 (**Appendix E**). The associated groundwater monitoring wells were subsequently abandoned on July 22, 2011. Because the RWQCB closed the case allowing residual contamination to remain in place, this former UST is considered a controlled recognized environmental condition (CREC). The RWQCB did not make any restrictions regarding the UST; however appropriate measures should be taken if digging is to occur in the area.
- o Two 12,000-gallon USTs were located at the northeast corner of APN 7271-008-016 at 1445 San Francisco Avenue (**Figure 3**). The tanks (one gasoline and one diesel), installed in November 1998, were removed on July 2, 2008. The RWQCB issued an NFA letter dated July 3, 2012 (**Appendix E**). These former USTs constitute an HREC with regard to the Property.
- o A Phase II Investigation (conducted in November 2010) and geophysical survey (conducted in July 2012) were performed on the southern portion of APN 7172-007-005 (**Figure 3**) in association with the historical gas station located at 949 West Anaheim Street, which is not a confirmed address of the Property, but was potentially located in this area. The November 2010 and July 2012 investigations of the southern portion of the Property did not identify any obvious signs of former USTs or associated fuel-impacts indicative of a release associated with former USTs. As a result, the potential of a former service station at 949 West Anaheim Street is considered an HREC.
- o Fill soil (presumed 1933 earthquake debris) was primarily anticipated on two parcels in the center of the contiguous portion of the former LBPSY (APN 7271-008-016 and adjacent parcel 7271-011-902) a Remedial Action Plan (SCS, March 2012, Revised May 2014). Very little fill soil existed on southerly portion of the Property (APN 7271-007-005; historically identified as APN 7271-007-902) and in order to expedite obtaining No Further Action (NFA) letters for the southern parcel, in anticipation of its imminent lease, a separate investigation was conducted at the southern end of the Property under Department of Human Health Services (DHHS) oversight. The results of this investigation (SCS, March 2, 2012) concluded that no evidence of significant impacts from lead or other metals associated with fill soil was identified. The DHHS subsequently issued an NFA letter for this parcel dated July 11, 2012 (**Appendix E**). Based on use of this parcel for storage purposes only, the presence of fill soils was previously considered to be an HREC, however, because the Property is now planned for redevelopment, the presence of the debris and lead-impacted soil that may be encountered, although anticipated to be minimal, is considered a REC. A soil management plan (SMP) should be prepared for management of any debris- and/or lead-impacted soil that may be encountered during planned re-development activities.
- o In January 2013, clarifiers associated with former car wash (located within the earthquake fill area) and paint rinse areas were removed. Clarifier abandonment activities were conducted with oversight provided by the Long Beach Fire Department

(LBFD) (SCS, February 2013). The DHHS issued an NFA letter dated March 13, 2013 (**Appendix E**). The clarifiers are considered an HREC with respect to the Property.

- o APNs 7271-008-016 (part of the Property) and 7271-011-902 (adjacent to the Property), historically APNs 7271-011-008 and 7271-008-013, which held the bulk of the suspected earthquake debris, were remediated between August 2014 and February 2015, as further discussed below.

Remedial Activities

The northern portion of the Property, APN 7271-008-016 (historically APNs 7271-011-008 and 7271-008-013) that held the bulk of the suspected earthquake debris was remediated between August 2014 and February 2015 with SCS oversight. Because of the volumes of lead-impacted debris on these parcels, negotiations between the owner, San Francisco Yard LLC (the “SFY”), and City of Long Beach (the “City”) were conducted to evaluate remedial alternatives for the Property. The remedial solution proposed and approved in the Remedial Action Plan was to move the impacted soil from the southern and eastern portions of the Property and place them in a capped area on the northwesterly portion of the site that the City would, in turn, purchase from SFY creating two “operable units,” as follows:

- o **Yard Parcel (currently APN 7271-008-016)** – This operable unit, owned by SFY, is an L-shaped, approximately 3.5 acre parcel that includes the southern portion of the block as well as a strip of land fronting San Francisco Avenue. Remediation of the Yard Parcel was proposed to meet cleanup goals, with a goal of receiving an NFA letter from the DHHS.
- o **Long Beach Parcel (currently APN 7271-011-902)** – This operable unit is a rectangular-shaped parcel, approximately 1.8-acres in area and is located outside the northwestern portion of the Property. This operable unit was used to stockpile the metals-impacted fill material, has been covered with two layers of a proposed 3 layer cap (third layer to consist of 1.5 feet of dirt to be placed in the future), and will be subject to a deed restriction as a condition of receiving an NFA letter. This parcel was purchased from SFY by the City.

As part of the remedial excavation activities of the Yard Parcel, approximately 44,000 cubic yards of impacted material was excavated from the Yard Parcel and placed on the Long Beach Parcel. Because debris extended beyond the Property boundaries, the impacted material was excavated to the extent possible without extending past the Property boundaries (i.e. into the river path). Therefore, impacted material will remain below the surface (and unexposed) in several other areas of the Property including: potentially beneath the building that remains on the northern portion of the Property (which will remain in place as part of re-development activities), along the western property line, and in an area where the Southern California Edison pole and support are located. The limited impacted areas that remain are depicted on **Figure 4** (included in **Appendix A**). As previously discussed, an SMP should be prepared for management of any debris- and/or lead-impacted soil that may be encountered during planned re-development activities.

Approximately 12,614 cubic yards of clean soil was imported from two construction sites for backfill of the remedial excavation area on the Yard Parcel. The excavation was backfilled, graded, and compacted prior to being paved with asphalt for use by Petros. A total of 78 confirmation samples (S1 through S78) were collected on a grid spacing of approximately every 50 feet. Concentrations of lead in the 78 samples ranged from non-detect (less than 2.5 milligrams per kilogram [mg/kg]) to 102 mg/kg, all well below the cleanup goal of 320 mg/kg. The DHHS issued an NFA letter for the

Yard Parcel dated April 27, 2015 (**Appendix E**). The presence of residual fill debris with elevated lead concentrations in certain areas of the Property, allowed by the DHHS, is considered a CREC. Additionally, based on the site inspection for this Phase I ESA the final cap for the Long Beach Parcel was not completed and therefore, as previously discussed, this represents a BER with respect to the Property.

As previously indicated, copies of all associated reports are included in **Appendix D**. Copies of NFA letters are included in **Appendix E**.

REGULATORY AGENCY RECORDS

Local regulatory agencies and other sources were contacted in an effort to identify any known or suspected contamination sites or incidents of hazardous waste storage or disposal which might have resulted in soil or groundwater contamination within a one-mile radius of the Property. Within the City of Long Beach, the LBFD generally acts as the lead enforcement agency for UST compliance. If soil or groundwater contamination is suspected, the DHHS generally acts as the lead enforcement agency for subsequent investigations. However, if groundwater has been affected, the RWQCB generally becomes the lead agency for contamination characterization and cleanup.

Files have previously been reviewed as part of the previous Phase I ESAs as discussed above. In addition, anything in the files since that time has been generated by SCS and also previously discussed. Updated file requests were submitted to the DTSC, RWQCB, LBFD, DHHS, and Los Angeles County Department of Public Works (LACDPW). Responses were received from the DTSC and LACDPW, indicating that no files were identified for the Property. As of the time of this report, files had not been returned from the DHHS, RWQCB, or LBFD. Based on the previous file reviews completed, the lack of responses from the other agencies does not represent a significant data gap.

12 REVIEW OF FEDERAL, STATE, TRIBAL, AND LOCAL GOVERNMENT DATABASES

A database search for sites listed on various federal, state, tribal, and local databases in the area around the Property was obtained from EDR (April 29, 2020). A description of each of the databases searched is included in the report, which is attached as **Appendix F**. Among the databases included in the EDR report are NPL (federal, tribal, and state-equivalent), proposed and delisted NPL, CORRACTS (RCRA facilities subject to corrective actions), hazardous waste sites identified for investigation or remediation (SEMS [Superfund Enterprise Management System, formerly known as CERCLIS], State CERCLIS, VCP, Brownfields Calsites, etc.), LUST, sites with engineering controls, former CERCLIS (NFRAP), RCRA and state hazardous waste generators, ERNS, SWLF, USTs, and Toxic Pits.

Review of these records satisfies all requirements as set forth in 40 CFR Section 312.26 (b) and (c) with regard to the review of federal, tribal, and state government records of databases of such government records and local government records and databases of such records pertaining to both the Property and the nearby or adjoining properties. Further, the search distances for each particular database are as specified in 40 CFR 312.26 and ASTM E1527-13.

Any known or suspected contaminated sites included on these lists within 0.25 miles of the Property are discussed in the following text. As a general rule, sites beyond 0.25 miles are not anticipated to impact a site significantly. Any sites beyond 0.25 miles with a high potential to impact the Property are also discussed. (Please note: the distances and directions listed in this report have been field verified and might not always match those in the EDR report.)

Sites such as TSD facilities, hazardous waste generators, HAZNET, FINDS, SQGs, LQGs, USTs, HIST UST, RCRA violations, and TRIS facilities with toxic chemical releases (generally in accordance with permitting requirements - into the air, water, or land as reported under SARA Title III) use or store hazardous materials and thus may pose a potential problem in the event of a spill or leak. However, unless these sites also appear in an agency list of contaminated sites, there is no evidence of any problems at this time. Therefore, sites on these lists will not be discussed unless on or in close proximity to the Property.

Please refer to **Appendix F** for further information on these sites.

PROPERTY LISTINGS

The Property is identified in the EDR database report as Anaheim Street and San Francisco Avenue, between 14th and 15th Street. The Property is identified on the NDPES and CIWQS databases. The database listings concerns a construction stormwater monitoring program that was terminated in 2015. No violations were reported for the Property.

Historical Property addresses 1475 San Francisco Avenue and 901 West Anaheim Street are identified in the EDR database report as City of Long Beach Testing Lab and Vehicle Tow Yard, respectively. The City of Long Beach Testing Lab is listed on the RCRA-SQG, FINDS, and ECHO databases. No violations were reported. Vehicle Tow Yard is listed on the HIST CORTESE database, likely associated with the former USTs located on the Property, which are discussed further in Section 11.

ADJACENT SITE LISTINGS

The Food Bank of Southern California, located adjacent to the Property to the west at 1444 San Francisco Avenue, is identified on the UST, HIST UST, SWEEPS UST, CA FID UST, LUST, HIST CORTESE, and CERS databases. A leak was reported on the site in 1990, and closure was issued by the RWQCB in 1996. Based on the case status (closed), the Food Bank of Southern California site is not anticipated to adversely affect the environmental condition of the Property.

G&J Forklift Inc., located adjacent to the Property to the east at 899 West Cowles Street, is listed on the RCRA NONGEN/NLR database as a hazardous waste transporter. No violations have been reported for the site, and based on the available information, G&J Forklift is not anticipated to have adversely impacted the environmental condition of the Property.

Seven Strand Tackle Corp, also located adjacent to the Property to the west at 899 Cowles Street, is listed on the HWTS, RCRA-SQG, CERS HAZ WASTE, FINDS, ECHO, HAZNET, and CERS databases. Between 1991 and 2005, Seven Strand Tackle Corp. manifested various quantities of liquids with pH less than or equal to two; oxygenated solvents; off-specification, aged, or surplus organics; other inorganic solid wastes; waste oil and mixed oil; unspecified solvent mixtures; alkaline solution without metals; and other empty containers 30 gallons or more. The site is listed as a Chemical Storage Facility, and violations for the site include observed high piled storage a permit, failure to complete and electronically submit a business plan when storing/handling a hazardous material at or above reportable quantities, failure to keep a copy of properly signed manifests, failure to report program data electronically, and improper storage of propane. All violations have been returned to compliance. Based on the available information, Seven Strand Tackle Corp. is not anticipated to have adversely impacted the environmental condition of the Property.

Air Products and Chemicals Inc., located adjacent to the Property to south at 901 West 12th Street, is listed on the SEMS-ARCHIVE, RCRA NONGEN/NLR, FINDS, ECHO, HWTS, CERS HAZ WASTE, CERS TANKS, HAZNET, and CERS databases. The site is listed as a recycler and transporter of hazardous wastes. No violations have been reported. The site is listed as a hazardous waste generator and aboveground petroleum storage facility. Between 1997 and 2017, various quantities of other inorganic solid waste; off-specification, aged, or surplus organics; unspecified oil-containing waste; other spent catalyst; waste oil and mixed oil; other organic solids; asbestos containing waste; unspecified aqueous solution; latex waste; and unspecified organic liquid mixture were manifested for disposal from the site. Based on the available information, Air Products and Chemicals Inc. is not anticipated to have adversely impacted the environmental condition of the Property.

OTHER DATABASE SITES

The EDR report provides a summary table of regulatory database sites within specified distances of the Property, including standard environmental records, additional environmental records, high risk historical records, and recovered governmental records. This summary table is provided beginning on Page 4 of the EDR report (**Appendix F**).

Other sites located within 0.25 miles of the Property with known releases of hazardous substances such as LUST, CPS-SLIC, SEMS, SEMS-ARCHIVE, and ENVIROSTOR are located cross- or downgradient, or based on case status and/or distance are not expected to negatively affect the environmental condition of the Property. However, some of these sites have recorded releases of substances including hydrocarbons and volatile organic compounds, and groundwater in the area has been impacted. Based on this information, it is possible that impacted groundwater from these sites has migrated beneath the Property. Several sites located within 0.25 miles appear in databases not typically associated with documented releases, such as RCRA NONGEN/NLR, HIST UST, AST, CORTESE, CERS, UST, SWEEPS UST, HIST UST, CA FID UST, FINDS, ECHO, CERS HAZ WASTE, HWTS, HAZNET, EDR HIST AUTO, EMI, SWF/LF, DRYCLEANERS, RCRA-SQG, FTTS, HIST FTTS, HAULERS, HWP, ENF, PADS, and MWMP. Based on a review of the information for these sites, they are not expected to negatively affect the environmental condition of the Property. Similarly, none of the sites situated beyond 0.25 miles are expected to negatively affect the Property.

UNMAPPABLE OR ORPHAN SITES

Eleven unmappable sites were identified in the EDR report. Unmappable sites cannot be plotted due to inaccurate or incomplete addresses. Based on review of the provided data, including the estimated locations of the unmappable sites in relation to the Property, it appears unlikely that the unmappable sites have adversely affected the environmental condition of the Property.

LANDFILLS

A review of the Major Waste Systems Map (June 1972) was conducted to locate any landfills or transfer stations within a one-mile radius of the Property. No landfills were identified within 0.5 mile of the Property.

According to the Solid Waste Facility/Landfill database provided by EDR, one active transfer station (Public Service Transfer Station #1) is located near the Property. According to EDR, this facility is operated by the City of Long Beach Department of Public Works and references an address of 1601 San Francisco Avenue. However, the facility is reportedly located east of the 710 Freeway between Anaheim Street and Pacific Coast Highway, which is located across the Los Angeles River to the west

of the Property. The facility is reported to be a limited volume transfer operation (less than 12 tons per day). According to the Solid Waste Information System (SWIS) the SWIS number for the facility is 19-AA-1047. Available information studied on the CalRecycle database, identified the last inspection date was February 26, 2020. The inspection documented that no issues were observed, the site was in satisfactory condition. Based on the available information, the transfer station is not anticipated to have negatively impacted the environmental condition of the Property.

OIL AND GAS WELLS

Available oil and gas well maps from the California Department of Conservation, Geologic Energy Management Division (CalGEM) were reviewed to identify oil and gas wells on the Property or in the nearby area. According to the CalGEM Well Finder online database, the property located within the Wilmington Oil Field, however no wells are in the general vicinity of the Property. Numerous oil wells are present approximately 300 feet west of the Property across the Los Angeles River Flood Control Channel. Since these wells are on the opposite side of the river, no significant environmental impact to the Property is anticipated from oil and gas exploration or production. A map showing the location of the Property relative to nearby oil and gas wells is provided in **Appendix E**. Based on the available information, no significant environmental impacts to the Property are anticipated from oil and gas wells.

NATIONAL PIPELINE MAPPING SYSTEM

SCS reviewed the National Pipeline Mapping System (NPMS) website for the Property and surrounding area to identify any hazardous materials pipelines. The NPMS is a geographic information system (GIS) created by the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration (PHMSA), and Office of Pipeline Safety (OPS) in cooperation with other federal and state governmental agencies and the pipeline industry. The NPMS consists of geospatial data, attribute data, public contact information, and metadata pertaining to the interstate and intrastate hazardous liquid trunklines and hazardous liquid low-stress lines as well as gas transmission pipelines, liquefied natural gas (LNG) plants, and hazardous liquid breakout tanks (tanks that receive and store liquids transported by pipeline) jurisdictional to PHMSA. The nominal accuracy of geospatial data in the NPMS is +/-500 feet. The NPMS does not contain information on interconnects, pump and compressor stations, valves, direction of flow, capacity, throughput, or operating pressure. In addition, distribution and gathering pipelines are not included in the NPMS.

The NPMS is built from data submitted by pipeline, LNG plant, and breakout tank facility operators. Since 2002, transmission pipeline and LNG plant facility operators are required to submit mapping information to the NPMS and to update their submissions annually. Breakout tank operators are able to submit data to the NPMS on a voluntary basis.

Based on review of the NPMS website, the closest hazardous materials pipelines are across the Los Angeles River Channel approximately 700 feet to the west of the Property. Based on the available information, no negative environmental affects to the Property are anticipated from these pipelines.

13 USER PROVIDED INFORMATION

A User Questionnaire was not returned to SCS for inclusion in the report. Alere Property Group LLC provided no information beyond what is discussed above.

TITLE RECORDS

No title report was provided to SCS for review.

ENVIRONMENTAL LIENS OR ACTIVITY AND USE LIMITATIONS

No information regarding environmental liens or activity and use limitations was provided to SCS. No environmental liens or activity/use limitations were identified by SCS during the course of this assessment.

SPECIALIZED KNOWLEDGE

No specialized knowledge regarding the Property was provided to SCS by the User.

VALUATION REDUCTION FOR ENVIRONMENTAL ISSUES

No property valuation information was provided to SCS.

14 DEGREE OF OBVIOUSNESS OF THE PRESENCE/LIKELY PRESENCE OF CONTAMINATION ON THE PROPERTY

The Property was vacant land from at least 1896 until approximately 1923, when at least three buildings were depicted on the Property. The Property has been used for commercial purposes since 1923. Property uses have included lumber companies, an animal hospital, roofing and construction companies, and various operations performed by Long Beach public service departments. Numerous potential environmental concerns have been identified at the Property, including fill material containing debris from the 1933 earthquake, historical operations including vehicle and equipment maintenance, a paint shop, clarifiers, and historical USTs. Based on the locations and natures of these operations, it is possible that waste oils, various pesticides, paint, and solvents were spilled or leaked over years of operation.

However, numerous phases of investigation and remediation have been conducted on the Property, including a site-wide Phase II investigation of soil and soil vapor, groundwater investigations, UST and clarifier removals, a limited Phase II investigation and geophysical survey for a potential former service station, a confirmations sampling report for two parcels with limited fill debris, and remediation of closure report for two parcels with the bulk of the fill debris. As a result of these activities, six NFA letters have been issued in association with the Property. The Property is currently slated for redevelopment, and although an NFA was issued, there is known lead-impacted soil/earthquake debris that may be encountered during grading activities. SCS anticipates that any material encountered will be limited, however the presence of the debris constitutes a REC for the Property.

15 DATA GAPS

A data gap represents an inability on the part of the environmental professional to obtain information required by the standards and practices of 40 CFR 312 to fully identify conditions indicative of releases or threatened releases of hazardous substances on, at, in, or to the Property.

Environmental records requests from the Long Beach Fire Department (LBFD) and RWQCB were not returned as of the time of this report. Based on the previous site investigations performed, this does not constitute a significant data gap.

16 FINDINGS AND OPINIONS

Based on the scope of work performed, SCS finds the following:

The Property is located on the west side of San Francisco Avenue, between West 15th Street and West Anaheim Street. It is approximately 6.66 acres and is currently occupied by the Petros Tubular (Petros) storage yard. The Petros storage yard consists of a small, approximately 5,600-square-foot warehouse/office building and outdoor material storage areas. A paved lot with a small portable “break room” trailer is located on the southern portion of the Property, which Petros uses mainly for truck parking.

The Property was vacant land in the late 1890s and early 1900s. By 1923, at least three buildings were present on the Property. Historical sources indicate that City of Long Beach municipal service buildings (garage, carpenter shop, storeroom, etc.) were constructed on the northern portion of the Property in the 1920s and 1930s. The southern portion of the Property was developed as a private lumberyard in the 1930s. By 1947, a road (an extension of West 14th Street) crossed the center of the Property, dividing it into two sections, with numerous commercial buildings on both the northern and southern portions. The 1950 Sanborn map identified the Long Beach City Yard and City of Long Beach Public Service Department as the occupants of the northern portion of the Property. Building uses included storage, labs, warehouses, woodworking and plumbing, a carpenter shop, and a paint shop. Fickling Lumber Company and an animal hospital occupied the southern portion of the Property, to the south of West 14th Street. Building uses included lumber storage, building materials warehouses, a planing mill, and kennels. David Roofing Company and Standard Stations Inc. Wilmington were listed as additional occupants of the southern portion of the Property (929 West Anaheim Street). By 1963, a paint shop and metal spray booth was present at the City yard on the northern side of the Property. By 1989, the lumberyard buildings located on the southern portion of the Property were removed and replaced with truck and vehicle parking. By 2012, most of the buildings previously located on the Property were removed, and the Property appeared to be in its present day configuration.

The site reconnaissance did not identify any recognized environmental conditions (RECs) associated with the current Petros operations at the Property. A city-owned parcel with a lead-impacted soil stockpile covered with vegetation adjoins the northern portion of the Property immediately to the west. Visual observation of this stockpile identified that a final cap does not appear to have been installed. The area, separated from the Property by privacy fencing, was partially overgrown with weeds and brush that would typically prevent aerial migration onto the Property during wind events. During the site inspection, SCS was informed that a small fire occurred on the stockpile in the past month. The western half of the stockpile appeared burned, and some of the foliage that had grown atop the stockpile was no longer present. The lead-impacted soil pile is considered a BER.

Numerous potential environmental concerns were identified during previous Phase I ESAs, including fill material containing debris from the 1933 earthquake, USTs, clarifiers, paint and solvent storage, parts cleaning, former pesticide storage, identification of a potential gas station, and waste oil storage. SCS has conducted several investigations and overseen remedial excavation of soil at the Property. Based on the results of these investigations, the DHHS and/or RWQCB have issued several NFA letters. No significant evidence of releases of hazardous substances from some areas of concern investigated; so these areas are considered HRECs. Former USTs removed from the Property that received NFA closure allowed residual contamination to remain in place, so these areas are considered CRECs. Earthquake debris and associated lead-impacted soil was excavated from much of the Property during remediation activities in 2014 and 2015. Some residual lead-impacted debris remains in place, including beneath the building, along the western Property line, and beneath

a Southern California Edison electrical pole. Since DHHS has issued an NFA letter for the residual contamination in place, while left undisturbed it is considered a CREC. In light of planned redevelopment activities that may disturb this soil during grading, however, it constitutes a REC.

Observations during the site inspection indicate that adjacent properties are currently occupied by numerous commercial/industrial operators. No obvious RECs for the Property were identified on these adjacent sites. However, regulatory database information also indicates that numerous sites within 0.25 miles of the Property have had releases of substances including hydrocarbons and volatile organic compounds (VOCs), and groundwater in the area has been impacted. Based on this information, it is possible that impacted groundwater from these sites has migrated beneath the Property. Since plans call for the Property to be redeveloped with a continued commercial/industrial use, SCS recommends that lead-impacted material be segregated and removed from the Property.

In summary, SCS performed a Phase I Environmental Site Assessment of the Property located at 1601 San Francisco, Long Beach, California, in conformance with the scope and limitations of 40 CFR 312 and ASTM E1527-13. Any exceptions to, or deletions from, this practice are described in Section 5 of this report.

In the opinion of the Environmental Professionals, this assessment has revealed evidence of a condition indicative of a recognized environmental condition in connection with the Property, as discussed above.

A soil management plan (SMP) should be prepared for management of any debris- and/or lead-impacted soil that may be encountered during planned re-development activities.

18 GLOSSARY/DEFINITIONS

AAI – All Appropriate Inquiry

AUL – Activity and Use Limitations

BTEX – Benzene, toluene, ethylbenzene, and total xylenes

CERCLA – Comprehensive, Environmental Response, Compensation, and Liability Act

CERCLIS – Comprehensive Environmental Response, Compensation, and Liability Information System

CFR – Code of Federal Regulations

CORRACTS – Corrective Action Against Responsible Parties at a RCRA site

CREC – A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (e.g., property use restrictions, AULs, or institutional or engineering controls).

DOGGR – Department of Oil, Gas, and Geothermal Resources

De Minimis Condition – A condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis conditions* are not RECs or CRECs.

DTSC – California EPA Department of Toxic Substances Control

EDR – Environmental Data Resources, Inc.

EPA – Environmental Protection Agency

ERNS – Emergency Response Notification System

ESA – Environmental Site Assessment

FINDS – Facility Index System

HAZNET – California EPA Hazardous Waste Facility and Manifest Data

HREC – Historical Recognized Environmental Condition: A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls

LOG – Large Quantity Hazardous Waste Generator

LUST – Leaking Underground Storage Tank

MCL – Maximum contaminant level

MTBE – Methyl-tert-butyl-ether

NFA – No Further Action determination

NFRAP – No Further Remedial Action Planned

NPL – National Priority List (Superfund)

PAHs – Polynuclear aromatic hydrocarbons

PCBs – Polychlorinated biphenyls

RCRA – Resource Conservation and Recovery Act

RCRIS – Resource Conservation and Recovery Information System

REC – *Recognized environmental condition* is defined by ASTM E 1527-13 as: “The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis conditions* are not *recognized environmental conditions*.”

ROD – Record of Decision

RBSLs – Risk-based Screening Levels

RSLs – Regional Screening Levels

RWQCB – Regional Water Quality Control Board

SARA – Superfund Amendments and Reauthorization Act

SLIC – Spills, Leaks, Investigations, and Cleanups database

SQG – Small Quantity Hazardous Waste Generator

SWIS – Solid Waste Information System

SWLF – Solid Waste Facility/Landfills

TPH – Total Petroleum Hydrocarbons

TRIS – Toxic Release Inventory System

TSD – Treatment, Storage, and/or Disposal Facility

User – The person or persons seeking to establish the innocent landowner defense, bona fide prospective purchaser liability protection, and/or contiguous property owner liability protection pursuant to CERCLA sections 101 and 107.

USGS – United States Geologic Survey

UST – Underground Storage Tank

VCP – Voluntary Cleanup Program

VOCs – Volatile organic compounds

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Application to Alter, Repair or Demolish

To the Department of Building and Safety of the City of Long Beach
Application is hereby made to the Department of Building and Safety of the City of Long Beach for the purpose hereinafter set forth. This application is made subject to the following conditions which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:
First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.
Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Long Beach.
Third: That the granting of the permit does not affect or prejudice any claim of title, or right of possession in, the property described in such permit.

DECLARATIONS

The Declarations below are mandated by the State of California under Section 19825 of the Health and Safety Code. The additional costs of printing and permit application processing caused by these requirements can only be passed on to the applicant as they are not recoverable from the state.

LICENSED CONTRACTOR'S DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

License Class C-21 License No. 335225

Date 12/23/81 Contractor A-1 LAND CLEARING

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, California Business and Professions Code: Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9 (Commencing with Sec. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violations of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars (\$500.00).):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, B. & P. C. The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.)

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.)

☐ I am exempt under Sec. _____, B. & P. C. for this reason:

Date 12-23-81 Owner MR Ruppinger

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure or a certificate of Worker's Compensation Insurance or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. WC 071-441-1 Company AMER STATES

☐ Certified copy is hereby furnished.

☒ Certified copy is filed with the Department of Planning & Building.

Date 12-23-81 Applicant MR Ruppinger

CERTIFICATE OF EXEMPTION FROM WORKER'S COMPENSATION INSURANCE

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Worker's Compensation Laws of California.

Date _____ Applicant _____

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Work's Comp. provisions of the Labor Code, You must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3907, Civ. C.).

Lender's Name _____

Lender's Address _____

I certify that I have read this application and state that the above information is correct. I agree to comply with all City, and State laws relating to the building construction, and hereby authorize representatives of this City to enter upon the above-mentioned property for inspection purposes.

MR Ruppinger 12-23-81
Signature of Owner or Contractor Date

— IMPORTANT —

Application is hereby made to the Superintendent of Building and Safety for a permit subject to the conditions and restrictions set forth on the front and rear faces of this application.

- Each person upon whose behalf this application is made and each person at whose request and for whose benefit work is performed under or pursuant to any permit issued as a result of this application agrees to, and shall, indemnify and hold harmless the City of Long Beach, its officers, agents and employees from any liability arising out of the issuance of any permit resulting from this application.
- Any permit issued as a result of this application becomes null and void if work is not commenced within ONE HUNDRED TWENTY (120) DAYS from date of issuance of such permit.

Address: _____ Project #: _____

1. OWNER-BUILDER'S DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors' State License Law for the reason(s) indicated below by the checkmark(s) I have placed next to the applicable item(s) (Section 7031.5, Business and Professions Code: Any city or county that requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for the permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors' State License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he or she is exempt from licensure and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars (\$500).).

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do ☐ all of or ☐ portions of the work, and the structure is not intended or offered for sale (Section 7044, Business and Professions Code: The Contractors' State License Law does not apply to an owner of property who, through employees' or personal effort, builds or improves the property, provided that the improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the Owner-Builder will have the burden of proving that it was not built or improved for the purpose of sale).

☐ I, as owner of the property, am exclusively contracting with licensed Contractors to construct the project (Section 7044, Business and Professions Code: The Contractors' State License Law does not apply to an owner of property who builds or improves thereon, and who contracts for the projects with a licensed Contractor pursuant to the Contractors' State License Law).

☐ I am exempt from licensure under the Contractors' State License Law for the following reason:

By my signature below I acknowledge that, except for my personal residence in which I must have resided for at least one year prior to completion of the improvements covered by this permit, I cannot legally sell a structure that I have built as an owner-builder if it has not been constructed in its entirety by licensed contractors. I understand that a copy of the applicable law, Section 7044 of the Business and Professions Code, is available upon request when this application is submitted or at the following Web site: <http://www.leginfo.ca.gov/calaw.html>.

Property Owner or Authorized Agent signature _____ Date _____

2. WORKERS' COMPENSATION DECLARATION

I hereby affirm under penalty of perjury one of the following declarations:

☐ I have and will maintain a certificate of consent to self-insure for workers' compensation, issued by the Director of Industrial Relations as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

☐ I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:
Carrier _____ Policy No _____ Exp Date _____
Name of Agent _____ Tel No _____

☐ I certify that, in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that, if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS (\$100,000.00), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

3. DECLARATION REGARDING CONSTRUCTION LENDING AGENCY

I hereby affirm under penalty of perjury that there is a construction-lending agency for the performance of the work for which this permit is issued (Section 3097, Civil Code).

Lender's Name and Address _____
By my signature below, I certify to each of the following:

- I have read this construction permit application and the information I have provided is true and correct.
- I agree to comply with all applicable Long Beach City, county ordinances and state laws relating to building construction.
- I authorize representatives of this city or county to enter the above-identified property for inspection purposes.

I am ☐ the property owner or ☐ authorized agent acting on the property owner's behalf.

The Notice to Property Owner form shall accompany this document. The property owner must complete the Authorization of Agent section on the form when an authorized agent is acting on the property owner's behalf.

Signature _____ Date _____

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR Historical Topo Map Report

04/29/20

Site Name:

929 West Anaheim Street &
1401 San Francisco Avenue
Long Beach, CA 90813
EDR Inquiry # 6052641.4

Client Name:

SCS Engineers
3900 Kilroy Airport Way
Long Beach, CA 90806
Contact: Kim Braun

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by SCS Engineers were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDR's Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:**Coordinates:**

LIMITED PHASE II ENVIRONMENTAL SITE ASSESSMENT
Potential O'Reilly Site – Fresno (F12)
2580 S. Elm Avenue
Fresno, California 93706

EXECUTIVE SUMMARY

ATC performed a Limited Phase II ESA of a Property referred to as the Potential O'Reilly Site – Fresno (F12) located at 2580 S. Elm Avenue, Fresno, California 95351 (the "Property"). The Limited Phase II ESA included subsurface investigation activities conducted on January 3 and February 8, 2018 by ATC (and ATC's sub-contractors). The purpose of the Limited Phase II ESA activities was to assess potential subsurface impact to the Property from *recognized environmental conditions* discussed below.

Background

ATC completed a Phase I ESA of the Property, dated November 28, 2017. The review of historical sources identified the historical presence of a gasoline station on the Property and was considered a *recognized environmental condition*. Based on findings in the Phase I ESA, ATC recommended a geophysical survey and a subsurface investigation to evaluate potential impact from USTs or other former activities reported for the Property.

Limited Phase II Environmental Site Assessment

A Limited Phase II ESA was performed on the Property on February 8, 2018 to collect soil samples to document if potential impact exists to the Property.

The obtained soil analytical results, for an applicable comparison criterion, were compared to the California Environmental Screening Levels for the Commercial/Industrial Scenario.

Soil

The soil analytical results indicated did not identify any detectable concentrations of Volatile Organic Compounds (VOCs), Gasoline Range Organics (GRO), or Total Extractable Petroleum Hydrocarbons (TEPH) as diesel. TEPH as motor oil was detected in the soil sample collected from ATC-2 at a depth of 10 feet bgs.

Nine of the CAM 17 metals were detected in the soil samples collected, but only arsenic concentrations exceeded California Environmental Screening Levels for the Commercial/Industrial scenario. The metals that were reported in the soil samples were generally uniform in detection and concentration. It appears that the arsenic did not come from activity occurring at the surface but is naturally occurring.

Recommendations

Historical hydrocarbon impact on the Property cannot be ruled out based on the data gathered for this Limited Phase II ESA. Hydrocarbon impacted soil was reported beneath the Property on in the suspected former excavation area (ATC-2). Impact was not reported in soils from the other locations across the Property. Since impacted soil was not encountered elsewhere on the Property, it is likely that any impact from the former gasoline service station activities were limited.

ATC recommends no further investigation at this time.

EXECUTIVE SUMMARY

SCS Engineers (SCS) was retained by Overland, Pacific & Cutler, Inc. on behalf of the City Attorney of the City of Long Beach to prepare a Phase I Environmental Assessment of the Long Beach Service Yard (APNs 7271-017-900, 7271-016-900, 7271-012-901, 7271-012-900, 7271-011-900, 7271-008-900, and 7271-007-902) in Long Beach, California (the "Property"). This assessment was performed in general conformance with ASTM requirements for Phase I Assessments (ASTM E1527-00).

Based on the scope of work performed, SCS finds the following:

- The Long Beach Service Yard consists of seven rectangular Los Angeles County Tax Assessor's Parcels that total approximately 689,913 square feet in area. The Property is located west of San Francisco Avenue and east of the Los Angeles River between Pacific Coast Highway and Anaheim Street in Long Beach, California. The six southern-most parcels of the Property are contiguous and include the intervening street rights-of-way, which have been incorporated into the Public Service Yard. The northern-most parcel (940 Pacific Coast Highway, APN 7271-017-900) is located on the north side of the adjacent city block, approximately 200 feet north of the other parcels.
- The Property is presently utilized for various operations performed by Long Beach Public Services (e.g. traffic management, street maintenance, and landscaping). The Property is occupied by 24 buildings, eight storage sheds, a carwash, two clarifiers, a fueling station with underground storage tanks of diesel and gasoline, four gravel bays, two aboveground tar emulsion tanks, an aboveground propane tank and several hazardous materials storage areas. The area surrounding the structures is paved, and the large open areas of the Property are utilized for storage and parking. The two clarifiers, which are utilized at a vehicle washing station and a paint equipment cleaning station, the paint spray booth and the hazardous materials storage areas are considered Recognized Environmental Concerns.
- Historical information indicates that portions of the Property were initially developed for commercial use as early as 1926, and have been used for commercial or industrial purposes since that time. Superior Laundry was identified in city directories on the Property in 1926. A veterinarian and kennels occupied a portion of the Property from at least 1929 through 1948. Lumber and building material companies (Fickling and Blue Diamond) occupied part of the Property from at least 1932 until the early 1980s, when records indicate that a portion of the Property was redeveloped with the City of Long Beach Tow Yard. The city tow yard was in operation until 1999; and that portion of the Property has been used for equipment and vehicle storage since that time. At least a portion of the Property appears to have been utilized by the City of Long Beach, as a "municipal garage," since as early as 1926. Various other city operations, such as a chemical laboratory and a machine shop have existed on the Property from as early as 1940 to present. The southwestern portion of the Property was occupied by De Forest

Avenue in 1963 and possibly as early as 1953 or earlier. City Tow Yard personnel indicated that the western portion of the Property, somewhat elevated with respect to the rest of the Property, is likely fill material, which may contain debris from the 1933 earthquake.

- Superior Laundry was identified on the Property at 1317 San Francisco Avenue in 1926. It is possible that this laundry conducted dry cleaning operations. Any dry cleaning operation in the 1920s would very likely have used a petroleum-based solvent (gasoline or Stoddard), and dry cleaning operations using petroleum products were, in SCS's experience, unlikely to have resulted in any significant environmental impact to the parcels they occupy. In summary, the presence of a "laundry" or possible dry cleaning operation in 1926 does not represent an environmental concern for the Property.
- Observations during the site inspection indicate that adjacent properties are currently occupied by: Long Beach Garage Door Co., Hydraulic and Automation Controls Co., The Food Bank of Southern California (and associated parking lot), 7-Strand, Ready Storage, BCIA Precision Casting, Graybar Distributor of Electrical and Comm/Data Products, Long Beach Seafood Co. Wholesale Outlet, Mylo's Custom Auto Body, Tacoma Express Inc., Truck Parking, Riley Marine Products, Goodwill (and associated parking lots), and Ocean Blue Environmental Services. No obvious recognized environmental concerns for the Property were identified on these adjacent sites.
- Regulatory database information identified the Property on the HAZNET, Cortese, LUST, RCRIS-SQG, FINDS, SWF/LF, EMI, and UST databases. The Cortese, LUST and UST database listings appear to relate to the current and historic UST operations, removals and cleanups. Other EDR report information indicated that wastes such as organic solids, oil-containing wastes, aqueous solutions with organic residues, asbestos containing waste, unspecified solvent mixture waste, and waste oil and mixed oil, were used on the Property. Additionally, the database report indicated that a transfer station operation formerly existed on the Property.
- Long Beach Fire Department information indicated that there are two 12,000-gallon USTs are currently in use, one gasoline and one diesel. These tanks are located on parcel 7271-008-900, between Cowles and 14th Street. At this time, there is no evidence in LBFD records that leaks or spills have occurred from these USTs.
- Historic on-site USTs included the following:
 1. 10,000-gallon unleaded gasoline, reportedly installed in 1966 and removed in January 1999. Regulatory closure received from Long Beach/Signal Hill Joint Powers Agency (JPA) in the "No Further Action" Letter dated March 25, 1999.
 2. 10,000-gallon diesel, reportedly installed on November 5, 1959 and removed in January 1999. Regulatory closure received from the JPA in the "No Further Action" Letter dated March 25, 1999.

3. 1,000-gallon unused UST, originally meant for solvent/kerosene, installed on July 19, 1988 and removed in January 1999. Regulatory closure received from JPA in the “No Further Action” Letter dated March 25, 1999.
4. 500-gallon kerosene UST, removed in July 1988. The location of this UST was at the southwest corner of San Francisco Avenue and Esther Street. One undertank soil sample contained 16,000 parts per million of hydrocarbons. A note dated March 25, 1999 on the City of Long Beach Environmental Health Underground Tank Program Tracking System summary states:

“Based on present closure guidance for low risk fuel contamination site fact sheet issued by the California Regional WQCB, Los Angeles Region, this site is low risk therefore no further action is required.”

Based on this information, no remediation of impacted soils was conducted.

5. 550-gallon gasoline UST – An “UST Unauthorized Release (Leak)/Contamination Site Report” dated May 29, 1996 indicated that on August 30, 1995 it was discovered that an unknown quantity of gasoline leaked from a 30 plus year old UST at 901 West Anaheim Street. This UST was removed by Maness Environmental on August 30, 1995, from a located in the 14th Street right-of-way 146 feet west of San Francisco Avenue and immediately north of the Tow Yard at 901 Anaheim. Soil and groundwater impacts were confirmed in investigations of the area. In a letter dated April 2, 2001, DHHS referred this case to the RWQCB. The Reynolds Group (TRG) prepared a workplan dated November 15, 2001 which was submitted to the RWQCB. The TRG Workplan was approved by the RWQCB in a letter dated February 19, 2002. No other information regarding this site was available in regulatory files.

The following records may be related to one or more of the USTs discussed above, or may be related to other historic USTs on the Property:

- Motor Oil UST – An UST Unauthorized Release (Leak)/Contamination Site Report dated August 4, 1995 indicated that 110 gallons of new motor oil were spilled from piping at 1725 San Francisco. No additional information regarding the location, investigation or regulatory status of this “unauthorized release” was identified in LBFD records.
- 10,000-gallon diesel UST – A “Flammable Liquids Permit,” issued on January 10, 1969, for the Public Service Yard at 1725 San Francisco Street, indicated that a 10,000-gallon diesel UST was to be installed on the Property. The permit also indicated that including this tank; there were a total of two tanks (with 20,000-gallons of capacity) and one pump at this address. Another permit application for a 10,000-gallon diesel fuel UST, for the City Public Service Yard at 1725 San Francisco Avenue, was approved on March 29, 1976; this permit may be related to an existing UST. No further information was found regarding the location or disposition of these tanks. Either or both of these records may

be related to the diesel UST removed by McLaren Hart in 1999. However, there is a discrepancy with regard to the installation date; the 10,000-gallon UST removed by McLaren Hart was reportedly installed in November 1959.

- Gasoline UST – A sketch map dated September 20, 1979 was identified with the address of 1601 San Francisco Avenue. Notes on the map indicated that this was a City of Long Beach project related to the installation of vapor recovery line for an existing gasoline tank. No further information related to this tank was identified. No details were present on the map to indicate the size or location of the tank. This record may be related to the 550-gallon gasoline UST at 901 Anaheim, or the 10,000-gallon unleaded gasoline located at 1725 San Francisco, reportedly installed in 1966 and removed in January 1999.

The following additional recognized environmental conditions were identified from historical information:

- Fill Material – City personnel indicated that fill material was placed on the western portion of the Property; the source of this material is unknown, but may include debris from the 1933 earthquake. Building debris from 1933 may contain asbestos, lead-based paint, or other issues of potential environmental concern. An obvious elevated area was noted during the site inspection on the northwestern portion of parcel 7271-011-900 (between 15th and Cowles Streets).
- Possible releases of waste oils, chemicals, and solvents, may have resulted from historical operations on the Property (e.g., chemical storage and use areas, paint shop, chemical laboratory, machine shop, etc.).
- Regulatory database information also indicates that numerous sites within 0.25 miles of the Property have had releases of substances including hydrocarbons and volatile organic compounds, and groundwater in the area has been impacted. Based on this information, it is possible that impacted groundwater from these sites has migrated beneath the Property.

In summary, the only parcel with **no recognized environmental concerns** is the northern-most of the seven parcels of the Property (940 Pacific Coast Highway, APN 7271-017-900); this parcel is approximately 200 feet north of the other parcels on the north side of the adjacent city block.

The remaining parcels contain one or more areas of environmental concern as shown in Figures 4 and 5, including fill material containing debris from the 1933 earthquake and petroleum-related impacts to soil and/or groundwater from underground fuel storage tanks. Further, historic operations on these parcels have included vehicle and equipment maintenance, paint shop, chemical laboratory, landscaping departments, machine shop, etc. The locations and nature of these operations appears to be transitory, and it is possible that waste oils, various pesticides, oils, paint and solvents have spilled or leaked over the 70 plus years of operation.

In conclusion, SCS has performed a Phase I Environmental Site Assessment of the Long Beach Public Service Yard, located on seven city blocks bounded by West Anaheim to the south, San Francisco Avenue to the east, Pacific Coast Highway to the north, and the Los Angeles River Flood Control Channel to the west, in Long Beach, California, in general conformance with the scope and limitations of ASTM Practice E1527-00. Based on the recognized environmental conditions discussed above, SCS recommends further investigation.

LONG BEACH, CALIFORNIA**

INTRODUCTION

SCS Engineers (SCS) was retained by Overland, Pacific & Cutler, Inc., on behalf of the City Attorney of the City of Long Beach, to prepare a Phase I Environmental Assessment of the Long Beach Service Yard which consists of seven Los Angeles County Tax Assessor's parcels (Assessor Parcel Numbers [APNs] 7271-017-900, 7271-016-900, 7271-012-901, 7271-012-900, 7271-011-900, 7271-008-900, and 7271-007-902) located west of San Francisco Avenue between Pacific Coast Highway and Anaheim Street in Long Beach, California (the "Property"). A location map for the Property is presented as Figure 1 (Appendix A). This assessment was performed in general conformance with ASTM E1527-00 guidelines for Environmental Assessment Reports.

PURPOSE

The purpose of this investigation was to identify any recognized environmental conditions as defined in ASTM Standard E1527-00:

“...the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.”

This assessment is intended to constitute an appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice, as required by the innocent landowner defense under the Comprehensive Response, Compensation, and Liability Act of 1980 (CERCLA a.k.a. Superfund), the Superfund Amendments and Reauthorization Act of 1986 (SARA), and the Small Business Liability Relief and Brownfields Revitalization Act of 2002. This process satisfies one requirement to qualify for the innocent landowner defense to CERCLA liability.

SCOPE OF WORK

This Phase I Environmental Assessment is based on:

- Field observations were made during Property reconnaissance visits performed on May 24, 2004 and August 10, 2004.
- Review of federal, state, and local regulatory databases. The search distances are those specified by ASTM E1527-00.
- Review of historical Property use information (topographic maps, aerial photographs, Sanborn fire insurance maps, etc.).
- Review of regulatory records at the Los Angeles Regional Water Quality Control Board (RWQCB) and the Long Beach Department of Health and Human Services (DHHS).

SPECIAL TERMS AND CONDITIONS

Property Access

Access to the Property for the site inspection on May 24, 2004 (for APN 7271-007-902) was provided by John Hough, Special Projects Officer for the Environmental Services Bureau of the City of Long Beach.

Access to the Property for the site inspection on August 10, 2004 (for the remaining six parcels) was provided by Greg Keys, Supervisor of the Structural/Anti-Graffiti operations for the City of Long Beach Public Works Department.

Use by Third Parties

This Phase I Environmental Assessment of the Long Beach Public Service Yard located west of San Francisco Avenue and between Pacific Coast Highway and Anaheim Street (APNs 7271-017-900, 7271-016-900, 7271-012-901, 7271-012-900, 7271-011-900, 7271-008-900, and 7271-007-902) in Long Beach, California has been prepared specifically for the City Attorney for the City of Long Beach, in care of Overland, Pacific & Cutler, Inc. The report has been prepared in accordance with the care and skill generally exercised by reputable professionals, under similar circumstances, in this or similar localities. No other warranty, expressed or implied, is made as to the professional opinions presented herein. This report is not a legal opinion.

No other party, known or unknown to SCS, is intended as a beneficiary of this work product, its content or information embedded therein. Third parties use this report at their own risk. Third party reliance letters may be issued on request and upon approval of the City Attorney of the City of Long Beach, and payment of a fee for such letters. SCS assumes no responsibility for the accuracy of information obtained from, compiled or provided by third-party sources such as regulatory agency listings.

LIMITATIONS AND ASSUMPTIONS

The investigation focused on potential sources of hazardous substances or petroleum products that could be considered a recognized environmental condition and/or a liability due to their possible presence in significant concentrations (e.g., above acceptable limits set by the Federal or state government) or due to the potential for contamination migration through exposure pathways (e.g., groundwater). Materials that may contain substances that are not currently deemed hazardous by the federal or state of California EPA were not considered as part of this study.

Unless specifically included in our scope of services, formal surveys for asbestos-containing materials, lead-based paints, fire safety, indoor air quality, mold, and similar matters were not part of this assessment. The Property was not evaluated for compliance with land use, zoning, wetlands, or similar laws. This report is not intended to be an environmental compliance audit.

Hazardous substances naturally occurring in plants, soils, and rocks, (e.g., heavy metals, naturally occurring asbestos, or radon) are not typically considered in these investigations. Similarly, construction debris (e.g., discarded concrete, asphalt) is not considered to be of concern unless observations suggest that hazardous substances are likely to be present in significant concentrations.

Unless otherwise noted, sampling and laboratory analyses of soil, water, air, building materials, or other media, were not performed as part of this investigation. Positive identification of hazardous substances can only be accomplished through sampling and appropriate laboratory analysis.

SCS Engineers assumes no responsibility for the accuracy of information obtained from, compiled by, or provided by third-party sources, such as regulatory agency listings. Unless obviously inaccurate or if information exists to the contrary, SCS Engineers assumes that information collected during this environmental site assessment is accurate and correct. Unless warranted, information collected has not been independently validated as part of this assessment.

GENERAL SITE CHARACTERISTICS

Site Location

The Property is located on seven city blocks bounded by West Anaheim to the south, San Francisco Avenue to the east, Pacific Coast Highway to the north, and the Los Angeles River Flood Control Channel to the west, in Long Beach, California. The six southern-most parcels of the Property are contiguous and include the intervening street rights-of-way which have been incorporated into the Public Service Yard. The northern-most parcel (940 Pacific Coast Highway, APN 7271-017-900) is located on the north side of the adjacent city block, approximately 200 feet north of the other parcels. Assessor's parcel maps of the Property are provided as Figures 2 and 2B of Appendix A. A 1994 aerial photograph of the Property and surrounding area is provided as Figure 3.

General Site Description

The Property consists of seven rectangular Los Angeles County Tax Assessor's parcels that are occupied by 24 buildings, eight storage sheds, a carwash, two clarifiers, a fueling station with underground storage tanks of diesel and gasoline, four gravel bays, two aboveground tar emulsion tanks, and an aboveground propane tank. The area surrounding the structures is paved, and the large open areas are utilized for storage and parking. According to the Los Angeles County Tax Assessor's parcel maps, the Property consists of one northern parcel that is 133.03 feet by 102.48 feet, or approximately 13,633 square feet in area; and six contiguous southern parcels and intervening streets that combined are approximately 2,120 feet by 319 feet, or approximately 676,280 square feet in area. The total approximate area of the Property is 689,913 square feet. Although the intervening streets are not part of the parcels, they are used by the City of Long Beach as part of the Public Service Yard and are thus included in this report.

Description of Adjoining Properties

All of the land surrounding the Property (and across the adjacent streets and Los Angeles River) is a mixture of commercial and industrial uses. The closest residential properties are located approximately 200 feet to the east, across San Francisco Avenue. Sketch maps showing adjacent property use are provided in Appendix B.

ENVIRONMENTAL SETTING

Physiographic Setting

According to the U.S. Geological Survey (USGS), Long Beach (1964, photorevised 1981), California 7.5 minute topographic map, the Property is located immediately east of the Los Angeles River at an elevation of approximately five feet above mean sea level about 1.3 miles north of San Pedro Bay. Regional topography is relatively flat with a gentle slope to the west.

Geology and Soils

Geologic maps indicate that surface sediments in the area are Quaternary alluvium and coastal deposits of silt, sand, and gravel that are underlain by the late Pleistocene Lakewood Formation. The Lakewood Formation, which consists of gravel, sand, sandy silt, silt and clay with shale pebbles, extends to a depth of approximately 100 feet (California DWR, Bulletin No. 104). Sediments below the Lakewood Formation belong to the late Pleistocene San Pedro Formation.

Groundwater

The Property is located in the southern portion of the West Coast Groundwater Basin. The first groundwater aquifer in the region is within the Gage Aquifer within the Lakewood Formation. First groundwater in the vicinity of the Property is approximately 10 feet below grade (DWR,

June 1961). There are no known regional groundwater contamination problems in this area. However, shallow groundwater has locally been impacted by saltwater intrusion; therefore, it is not used as a drinking water source. Groundwater flow direction is anticipated to be generally westerly towards the Los Angeles River/Flood Control Channel adjacent to the Property. Groundwater beneath the Property is likely tidally influenced by the river in this area.

SITE INSPECTION

Inspections of the Property and the surrounding area were conducted by Kevin Green and Tara Holmes of SCS on May 24, 2004, and by Tara Holmes on August 10, 2004. Sketch maps and photographs of the Property taken during the inspections are provided in Appendix B.

A parcel-by-parcel description of the Property, from south to north, is presented in the following narrative.

Assessor's Parcel Number 7271-007-902

The southernmost parcel (APN 7271-007-902) consisted of the abandoned Long Beach City Tow Yard at 901 West Anaheim Street. The lot was largely vacant and was surfaced primarily with asphalt but included several concrete-paved areas. A long narrow single-story building was situated in the southeastern corner of the lot and extended northward along the eastern edge of this parcel. The building appeared to consist of former offices and five former garages/service bays; access to the entire building was not available.

A partial sidewalk, median, and curbs ran in a north-south direction through the western portion of the lot. Their presence, along with a storm-drain located within a curb in the southwest corner indicates that a street was formerly present on the western portion of this parcel.

At least a dozen apparently abandoned vehicles, a non-hydraulic aboveground vehicle lift, four underground storage tanks along the western edge of the parcel, and other debris, were noted during the inspection. Hydrocarbon-stained asphalt and concrete in the central and northeastern areas of this parcel were noted during the site inspection; no impact to the Property is anticipated from this surface staining.

Assessor's Parcel Number 7271-008-900

The parcel between 14th Street and Cowles Street (APN 7271-008-900) was largely paved with asphalt and occupied by two buildings, which function as storage sheds and offices, which were located on the southeastern portion of the parcel. An emergency generator trailer, a work shed, a storage shed, a car wash with a clarifier, a paint equipment cleaning area with a clarifier, a 1,000-gallon above-ground propane tank, a flammable products storage cabinet, and a gasoline/diesel fueling station with two underground storage tanks (USTs) also occupied various portions of the parcel. The undeveloped western portion of the parcel was utilized for storage of traffic posts, city artifacts, roof tiles, and various other construction-related items.

An address of 1409 San Francisco Avenue was observed on the office building farthest to the east.

Assessor's Parcel Number 7271-011-900

The parcel between Cowles Street and 15th Street (APN 7271-011-900) was occupied by eight buildings and a hazardous waste cage. The undeveloped portions of the parcel were occupied by paved parking lots. One of the buildings was an empty office building. Other buildings include one or more of the following uses: carpentry, a locksmith operation, a traffic management warehouse, electrical equipment waste storage, and a paint shop with a spray booth. Two abandoned buildings were formerly utilized for pesticide storage, and a chemical laboratory. No access was provided for the former pesticide storage building.

A fenced and locked hazardous waste storage area containing 55-gallon drums of mineral spirits was located north of the paint shop. The storage area was labeled and the drums were placed on secondary containment platforms.

Assessor's Parcel Number 7271-012-900

The parcel between 15th Street and 16th Street (APN 7271-012-900) was occupied by six buildings that were surrounded by pavement. An address of 1601 San Francisco Avenue was observed on the Administration building. One of the buildings was a vacant storage shed. Other buildings include one or more of the following uses: administration, traffic management operations, traffic management offices, electrical shop offices, computer operations, a telephone room, a plumbing office, an air conditioning office, a custodial office, a meter shop, and traffic paint operations. A storage area for traffic paints was located to the west of the traffic paint building.

Assessor's Parcel Number 7271-012-901

The parcel between 16th Street and 17th Street (APN 7271-012-901) was occupied by five buildings that were surrounded by pavement. Two of the buildings were vacant. Other building uses included a welding office, the Landscape Division offices, a training center, and a welding shop.

Assessor's Parcel Number 7271-016-900

The parcel between 17th Street and Esther Street (APN 7271-016-900) was occupied by four buildings, three storage areas, a hazardous waste storage area, four storage bays for building materials such as gravel and sand, and two aboveground tar emulsion tanks. All of the structures were surrounded by pavement. Building uses included an emergency response office, the 17th Street Pumping Station (for storm water), a Street Division office, and a chain-saw/landscape

equipment repair facility. The storage areas were utilized for Street Division supplies, such as traffic cones and barricades.

The hazardous waste storage area was occupied by five drums that contained clean oil and waste oil. The waste oil drums were stored on secondary containment platforms. Four building materials storage/loading bays were located in the northwestern corner of the lot. South of the building materials bays were two aboveground tar emulsion tanks which were enclosed by a low cinder block wall to provide secondary containment.

Another partial containment area comprised of brick was located south of the emulsion tanks. As indicated by signs for "paint thinner" and "used oil," it would appear that the area was formerly utilized for the storage of these items. No storage of hazardous materials was observed during the inspection.

A pad-mounted Southern California Edison (SCE) transformer surrounded by traffic posts was located north of the 17th Street Pumping Station.

Assessor's Parcel Number 7271-017-900

Assessor's parcel 7271-017-900 was bounded by Pacific Coast Highway to the north, a Goodwill Parking Lot to the east, Ocean Blue Environmental Services to the south, and the Los Angeles River Flood Control Channel to the west. The parcel consisted of an asphalt-paved lot that was occupied by several city work trucks and two piles of asphalt gravel. No structures were located on this parcel.

Hazardous Substances

Several hazardous substances storage areas were located on the Property. Hazardous substances identified during the site inspection included new oil, waste oil, tar emulsion, propane, paint, mineral spirits, unleaded gasoline, diesel gasoline, and various other chemicals stored in small quantities within cabinets designated for flammable materials.

Natural Drainage

Natural waterways are not currently located on the Property. The Los Angeles River Flood Control Channel is located immediately east of the Property. According to Greg Keys of the Public Works Department, the Property accumulates up to three feet of standing water during heavy rain events. Typically, runoff from the Property drains to the surrounding streets then into stormwater drains; however, a pump station was recently installed on the Property to reduce the accumulation of water during heavy rain events.

Disturbed Areas

No obvious signs of disturbed areas were noted on the Property.

Elevators and Other Hydraulic Equipment

No elevators or other hydraulic equipment were observed on the Property. A non-hydraulic lift was observed on the southern-most parcel (7271-007-902) to the north of the former garage bays.

Wells

No water supply or monitoring wells were observed on the Property.

Electrical Equipment

One Southern California Edison (SCE) pad-mounted transformer was present on the Property to the north of the 17th Street Pumping Station (APN 7271-016-900). Per Greg Keys of the Public Works Department, the transformer was installed at the same time as the pump station, which was reportedly built approximately four years ago. Sixteen pole-mounted SCE electrical transformers were also observed adjacent to the Property, in various locations along the east side of San Francisco Avenue.

SCE has stated that they have never specified the purchase of distribution transformers utilizing PCBs as the insulating/cooling fluid. SCE transformers utilize mineral oil exclusively. In a statistically valid test of over 20,000 SCE distribution transformers, SCE determined that the concentrations of PCBs in the mineral oils was less than 50 parts per million (ppm) in over 96 percent of the units. SCE is responsible for the operation of the transformers, and the investigation and cleanup of any spills or leaks. No signs of leaks from the transformers were observed. Based on available information, no significant environmental impact to the Property is anticipated from these transformers.

Wastewater

Domestic sanitary sewage generated on the Property, if any, would be discharged to the city sewer system. There appear to be industrial wastewater discharges from the two clarifiers associated with the vehicle wash and paint shop areas.

Drinking Water

Drinking water is supplied to the Property by the City of Long Beach. All large public water suppliers in California have been required to test their water and comply with federal and state drinking water standards since the mid-1980s. Consequently, lead and other contaminants of concern are not expected to be present in the drinking water supply above applicable primary and secondary drinking water standards.

Storage Tanks

Four underground storage tanks and associated dispensers were stored, aboveground, near the southwestern corner of the Property (APN 7271-012-902). During the site visit on May 24, 2004, Mr. Roberto Uranga, superintendent of towing and lien sale indicated that the aboveground tanks were likely from another city facility, and were not used on the Property.

One aboveground 1,000-gallon propane tank was present on the parcel (APN 7271-008-900) bounded by 14th Street to the south and Cowles Street to the north. Two underground storage tanks were also present on this parcel at the fleet fueling station. As discussed below, Long Beach Fire Department records indicated that these are each 12,000-gallon tanks – one gasoline and one diesel.

Two aboveground tar emulsion tanks are also located at 1725 San Francisco Avenue (APN 7271-016-900). These tanks are surrounded by a secondary containment structure of cinder block.

Asbestos-Containing Building Materials (ACBMs)

In general, buildings constructed before 1985 have a high potential for ACBMs. The manufacture of most ACBMs (except roofing tars/mastics) ended in the late 1970s. However, existing inventories of products could still be used. In addition, roofing tars and mastics can still contain asbestos. Thus, ACBMs can be present in building materials regardless of age or date of construction (for example, in roofing felt, vinyl flooring, dry wall mud, etc.). Without sampling and analysis, it is not possible to definitely identify ACBMs.

Based on known or likely construction dates for structures on the Property (discussed later in this report), it is likely that ACBMs are present in at least some of structures.

Lead-Based Paint

Lead-based paint (LBP) has been used on structures since the late 1800s. LBP use peaked in the 1920s and gradually fell off until its ban. About 3 of 4 houses built before 1980 contain LBP. In 1973, the Consumer Product Safety Commission (CPSC) established a maximum lead content in paint of 0.5 percent by weight (or 1.0 mg/cm²) in a dry film of newly applied paint. In 1978, the CPSC lowered the allowable lead level in paint to 0.06 percent. The use of LBP was not prohibited until 1980. The presence of LBP cannot be determined without testing.

According to historical information, at least some city-utilized structures existed on the Property as early as 1926. Although the construction dates of all of the current structures on the Property are not known, it is possible and perhaps likely that lead-based paint is present on some structures.

Adjoining Site Observations

Businesses observed on adjoining sites during the site inspection included: Long Beach Garage Door Co., Hydraulic and Automation Controls Co., The Food Bank of Southern California (and associated parking lot), 7-Strand, Ready Storage, BCIA Precision Casting, Graybar Distributor of Electrical and Comm/Data Products, Long Beach Seafood Co. Wholesale Outlet, Mylo's Custom Auto Body, Tacoma Express Inc., Truck Parking, Riley Marine Products, Goodwill (and associated parking lots), and Ocean Blue Environmental Services.

No recognized environmental conditions (e.g., USTs, monitoring wells, remediation systems, etc.) were identified on any of the adjoining sites during the site inspection.

SITE HISTORY

Site history was evaluated from the following sources:

- U.S. Geological Survey (USGS), Long Beach, California 7.5 minute topographic series map (1964, photorevised 1981).
- Historical aerial photographs dating from 1953, 1958, 1963, 1972, 1989, and 1997, from the Rupp Aerial Photography Collection.
- City of Long Beach Department of Building and Safety building permit information.
- City of Long Beach Fire Department.
- Los Angeles County Tax Assessor.
- Sanborn Fire Insurance maps from the years 1949 and 1963 obtained from the EDR-Sanborn collection.
- City directories from in-house resources were reviewed for the years 1926, 1929, 1932, 1940, 1943-44, 1945, 1948, 1953, 1958, 1963, 1964, 1965, and 1968.

Topographic Maps

The Property and surrounding area are depicted as an area of urban development. No structures are shown on the Property. The closest landmark building is Seaside Memorial Hospital approximately 0.03 miles east of the Property.

Aerial Photographs

In all of the aerial photographs (1953 through 1997) the Property appeared to be occupied by 20 to 30 buildings used for commercial or industrial purposes. The remainder of the Property

appeared to be either vacant or paved. The areas to the east and south appeared to be occupied by a mixture of commercial/industrial buildings and vacant lots. The area to the north (across Pacific Coast Highway) appeared to be primarily residential, and the area to the west was occupied by the Los Angeles River Flood Control Channel.

Copies of aerial photographs are included in Appendix C.

County Tax Assessor

The Los Angeles County tax assessor's website did not provide useful information regarding addresses, year of construction of any improvements, or the use of parcels on the Property.

Sanborn Fire-Insurance Maps

A summary of the uses of the Property and surrounding area as depicted on the 1949 map is as follows:

APN	Depicted Address(es)	No. of Buildings	Year of Map	Use/Comments
7271-007-902	909-935 West Anaheim 1301-1327 San Francisco	6-10	1949	Most buildings appeared to be associated with Fickling Lumber Company. A dog and cat hospital and kennel occupied the southeastern corner of the Property.
7271-008-900	901-935 14 th Street 1401-1445 San Francisco	13	1949	Buildings included warehouses and other small structures that were identified as part of the Long Beach Public Service and Recreation Departments.
7271-011-900	926 15 th Street 1451-1485 San Francisco	11	1949	Buildings were identified as a lab, storage facility, a repair shop, a kennel, gas chambers, a hutch, and an office. All buildings were associated with the Long Beach City Yard.
7271-012-900	925 15 th Street 916 16 th Street	None	1949	Vacant
7271-012-901	921-925 16 th Street 1607-1649	8	1949	Buildings were depicted as: offices, cement and car storage, and general storage. A large structure identified as a

APN	Depicted Address(es)	No. of Buildings	Year of Map	Use/Comments
	San Francisco			sump/storm drain was located on the southern portion of the parcel. All buildings were associated with the Long Beach City Yard.
7271-016-900	926 West Esther 1781 San Francisco	7	1949	Buildings were depicted as: an office, a lantern shop, and garages. All buildings were associated with the Long Beach City Yard.
7271-017-900	940 West Pacific Coast Highway	1	1949	A single apparently residential structure with 34 rooms was depicted.

The adjacent properties to the east, across San Francisco Avenue, included: truck parking, vacant lots, Adhor Milk Farms, truck services, an office, plumbing supplies, a machine shop, and tourist court units. The area to the south, across West Anaheim, appeared to be occupied by a plumbing supply company and a vacant building. An auto court and dwellings occupied the area to the north across Pacific Coast Highway. The Los Angeles River Flood Control Channel occupied the area to the west.

The address ranges for the Property were depicted as 909 through 935 West Anaheim (odd numbers), 1301 through 1781 San Francisco Avenue (odd numbers), and 901-935 14th Street, Cowles Street, 15th Street, 16th Street, 17th Street, and Esther Street (all numbers), and 940 West Pacific Coast Highway.

A summary of the uses of the Property and surrounding area as depicted on the 1963 map is as follows:

APN	Depicted Address(es)	No. of Buildings	Year of Map	Use/Comments
7271-007-902	1301 San Francisco	4	1963	Buildings were associated with A.E. Fickling Lumber Company. Buildings were depicted as: lumber storage, a mill, and building supplies. De Forest Avenue ran north-south through the western portion of the lot.
7271-008-900	901-935 14 th Street	12	1963	Buildings were depicted as: a paint shop, storage, a parking meter department, electrical,

APN	Depicted Address(es)	No. of Buildings	Year of Map	Use/Comments
	1445-1455 San Francisco			woodworking & plumbing, a saw shed, paint storage, and surveyors' equipment. All structures were part of the Long Beach Public Service Department.
7271-011-900	926 15 th Street 1451-1485 San Francisco	12	1963	Buildings were depicted as: a lab, storage facilities, a repair shop, a paint shop with a metal spray booth, and offices. All buildings were associated with the Long Beach City Yard.
7271-012-900	925 15 th Street	3	1963	Buildings were depicted as: offices, a sign shop, a paint shop, and car storage. All buildings were associated with the Long Beach City Yard.
7271-012-901	925 16 th Street 1607 San Francisco	10	1963	Buildings were depicted as: "autos and storage," general storage, and a sump/storm drain. All buildings were associated with the Long Beach City Yard.
7271-016-900	926 West Esther	6	1963	Buildings were depicted as: an office, tool and cement storage, a lantern shop, and a rock bunker. All buildings were associated with the Long Beach City Yard. A notation indicated "Gas and Oil in Yard".
7271-017-900	940 West Pacific Coast Highway	1	1963	Building depicted as the Southern Motel Inn

The adjacent properties to the east, across San Francisco Avenue, included: truck parking, vacant lots, a liquor market, a trucking company, a food facility, a meat refrigeration site, offices, truck services, plumbing supplies, a machine shop, and tourist court units. The area to the south, across West Anaheim, appeared to be occupied by an electric appliance warehouse. The area to the north, across West Pacific Coast Highway was occupied by dwellings. The area to the west was occupied by the Los Angeles River Flood Control Channel.

The address ranges for the Property were depicted as 901 through 935 West Anaheim (odd numbers), 1301 through 1607 San Francisco Avenue (odd numbers), and 901-935 14th Street, Cowles Street, 15th Street, 16th Street, 17th Street, and Esther Street (all numbers), and 940 West Pacific Coast Highway.

Copies of the Sanborn Maps are included in Appendix C.

City Directories

In-house copies of Long Beach City Directories for the Property address range of 1301 through 1799 San Francisco Avenue [odd]; 901 through 935 West Anaheim [odd]; 900 through 1000 Pacific Coast Highway [even]; and 900 through 1000 West 14th Street, West Cowles Street, West 15th Street, West 16th Street, West 17th Street, and West Esther [all], were reviewed for the years 1926 through 1968. Directories for the Property were primarily comprised of residential and commercial listings (e.g. a refrigerator shop, a motel, a building materials corporation etc.). The following entries for the Property were the only listings of environmental concern:

Year	Address	Listing
1926	1317 San Francisco	Superior Laundry
1926	1401 San Francisco	Municipal Garage
1929	1401 San Francisco	Municipal Garage
1932	1401 San Francisco	City Garage
1940	1475 San Francisco	City Chemist and Testing Engineer
1943-44	929 West Anaheim	Fickling A.E. Lbr Co.
1943-44	1475 San Francisco	City Chemist and Testing Engineer
1945	1475 San Francisco	City Chemical and Test Lab
1945	1751 San Francisco	B & A Machine Shop
1948	1317 San Francisco Avenue	LB Janitor Shop
1948	1475 San Francisco	City Chemical and Test Lab
1948	1751 San Francisco	B & A Machine Shop
1948	815 17 th Street	Lieberman WH printer (btwn SF and Pico)
1953	929 West Anaheim	Fickling A.E. Lbr Co.
1953	1475 San Francisco	City Chemical and Test Lab
1943	1751 San Francisco	B & A Machine Shop
1958	1475 San Francisco	City Chemical and Test Lab
1958	1751 San Francisco	B & A Machine Shop
1958	929 West Anaheim	Fickling Lbr Co. Inc.
1963	929 West Anaheim	Fickling Lbr Co. Inc.; Amundsen Delman
1963	1475 San Francisco	City Chemical and Test Lab
1964	1475 San Francisco	City Chemical and Test Lab
1965	1475 San Francisco	City Chemical and Test Lab
1968	1475 San Francisco	City Chemical and Test Lab
1968	929 West Anaheim	Fickling Lbr Co. Inc. Ret

An item of potential environmental concern is the presence of a “laundry” or possible clothes cleaning operation in 1926 at 1317 San Francisco Avenue; this business is not shown on the Property in 1929. It is not possible to determine if the “laundry” was conducting typical laundry or dry cleaning operations. In the early Twentieth Century, gasoline was the main dry cleaning fluid in the U.S. By 1928, the U.S. Department of Commerce had issued a standard for the use of Stoddard solvent (a petroleum distillate) for dry cleaning. As late as 1955, Stoddard solvent (a petroleum distillate) use still dominated the industry. The use of PCE as a dry cleaning fluid began in the U.S. in about 1934, primarily to replace the carbon tetrachloride that had been the principal competitor to Stoddard solvent. Therefore, any dry cleaning operation in the 1920s would very likely have used a petroleum-based solvent (gasoline or Stoddard), and dry cleaning operations using petroleum products were, in SCS’s experience, unlikely to have resulted in any significant environmental impact to the parcels they occupied. In summary, the presence of a “laundry” or possible dry cleaning operation in 1926 does not represent an environmental concern for the Property.

Possible mismanagement of waste oils, solvents, and various chemicals from other former Property uses listed above, including a municipal/city garage, a chemical/testing laboratory, and a machine shop, may pose an environmental concern for the Property.

Additionally, it should be noted that a listing for “City Tow Service and Garage Inc.” was observed in the 1968 city directories for 1630 San Francisco Avenue, which is not part of the Property. Another listing in the 1968 city directory for the “City Public Service Department” was observed for the address of 1601 San Francisco, which is part of the Property. Since the city directory coverage (if any) past 1968 was not reviewed by SCS, the number of years that the City Tow facility operated at the off-site address of 1630 San Francisco is unknown. These listings indicate that both of these addresses were concurrently used by the city.

Long Beach Department of Building and Safety

Building permits for the known and estimated Property address ranges of 1301 through 1799 San Francisco Avenue [odd]; 901 through 935 West Anaheim [odd]; 900 through 1000 Pacific Coast Highway [even]; and 900 through 1000 West 14th Street, West Cowles Street, West 15th Street, West 16th Street, West 17th Street, and West Esther [all], were reviewed with the City of Long Beach Department of Building and Safety. The following permits for the Property were identified:

Permit Date	Address	Owner	Comments
10/17/29	901 West 14 th Street	City of Long Beach	Use: Storage Shed
7/31/29	901 West 14 th Street	City of Long Beach	Use: Municipal Garage
11/18/32	901 West 14 th Street	City of Long Beach	Use: Carpenter Shop and Store Room
5/25/39	1449 San Francisco	City of Long Beach	Use: Bunkers and Truck shed

Permit Date	Address	Owner	Comments
11/16/36	960 West 14 th Street	A.E. Fickling.	Lumber Storage
4/28/39	940 West Pacific Coast Highway	A.L. Eaton	Use: Hotel and Cafe
7/29/41	1643 San Francisco	City of Long Beach	Proposed use: Warehouse
11/23/43	940 West Pacific Coast Highway	Happy Cooper	Present use: Vacant
8/28/45	940 West Pacific Coast Highway	Happy Cooper	Use: Motel
10/5/48	940 West Pacific Coast Highway	M.C. Hall	Use: Motor court rooms
6/16/50	1601 San Francisco	City of Long Beach	Proposed use: Administration Building
6/16/50	1601 San Francisco	City of Long Beach	Proposed use: Vehicle storage and repair
10/2/51	929 West Anaheim	A.E. Fickling	Adding room to office
11/14/51	929 West Anaheim	A.E. Fickling	Add sanding to mill bldg
1/3/52	929 West Anaheim	A.E. Fickling	Lumber storage
5/23/52	1601 San Francisco	City of Long Beach	Use: Paint shop and vehicle shed
8/4/52	929 West Anaheim	Fickling Lumber Co.	Use: Mill building
9/2/53	929 West Anaheim	A. Fickling	Use: Lumber Storage
9/2/53	929 West Anaheim	A. Fickling	Use: Lumber office
5/28/68	1645 San Fernando	City of Long Beach	New storm drain pump station
2/10/69	1601 San Francisco	City of Long Beach	Proposed use: Sign shop
12/28/81	929 West Anaheim	City of Long Beach	Demolish wood shed
7/27/82	901 West Anaheim	City of Long Beach	Constr new office & 10 garages - Permit stamped VOID
2/9/83	1317 San Francisco	City of Long Beach	Change address to 901 West Anaheim
3/8/84	901 West Anaheim	City of Long Beach	Demo existing bldg - Permit stamped VOID
7/6/88	7125 San Francisco	City of Long Beach	Removal of one 500-gallon capacity kerosene UST and soil sample collection.
9/10/90	940 West Pacific Coast Highway	Patel, Balubhai	Demo hotel building to ground level.
5/28/84	940 West Pacific Coast Highway	Cuandulal & Babuhai, Patel	Use: Motel

Permit Date	Address	Owner	Comments
2/10/95	1601 San Francisco	L.B. Pub Serv	Conv storage bldg into traffic signal office

Uses of the Property including a municipal garage, vehicle repair, a paint shop, and the former presence of an underground kerosene tank, may pose an environmental concern for the Property.

City of Long Beach Fire Department

The 2003 City of Long Beach Fire Department (LBFD) Underground Storage Tank (UST) database was reviewed for the address ranges of the Property 1301 through 1799 San Francisco Avenue [odd]; 901 through 935 West Anaheim [odd]; 900 through 1000 Pacific Coast Highway [even]; and 900 through 1000 West 14th Street, West Cowles Street, West 15th Street, West 16th Street, West 17th Street, and West Esther [all], as part of this assessment. The database contains addresses where USTs were located and has notes regarding their status. The following listings were identified:

- 929 West Anaheim** - A listing for the address of 929 West Anaheim indicated that on September 7, 1945 Fickling Lumber removed a 280-gallon capacity UST and installed a 550-gallon capacity UST. Another listing for the same address indicated that a 550-gallon capacity diesel UST was removed in August of 1995. This latter listing indicated that the permit was pulled under the address of 901 West Anaheim and stated "see 1630 San Francisco," which indicates that information for that UST was filed under the San Francisco address.
- 1630 San Francisco Avenue** - Although this address is across the street from the present Public Service Yard and not a part of the Property, based on SCS's review of city directories and building permits, it appears the city tow yard operated at and used the mailing address of 1630 San Francisco Avenue from at least 1965 through 1984. LBFD records also indicate that USTs were located on this site. To evaluate whether "city tow" UST records associated with this site were commingled with those of the "city tow" yard on the Property, SCS conducted a review of information for this address. The database listing for 1630 San Francisco indicates that two USTs were removed in 1975 and two more were removed in 1984; there is no information regarding the removal of a 550-gallon tank from 929 West Anaheim in 1995 as discussed above.
- 1725 San Francisco Avenue** - A listing for the address of 1725 San Francisco Avenue indicated that three tanks were removed in January of 1999. Two of the tanks reportedly had a 10,000-gallon capacity, and were used for gas and diesel, and the third tank reportedly had a 1,000-gallon capacity and had never been used. A database note from March of 1999 indicated that the site was deemed "clean" by the Long Beach Health Department.

A document search was conducted at the City of Long Beach Fire Department for the address ranges of 1301 through 1799 San Francisco Avenue [odd]; 901 through 935 West Anaheim [odd]; 900 through 1000 Pacific Coast Highway [even]; and 900 through 1000 West 14th Street, West Cowles Street, West 15th Street, West 16th Street, West 17th Street, and West Esther [all].

It should be noted that SCS also reviewed records related to USTs for the historic city tow yard at 1630 San Francisco Avenue for any information relevant to this assessment. Although numerous UST-related records were reviewed, all of the information appears to be related to the use and replacement of USTs at this location (across the San Francisco Avenue from the Property); none of the information appears to be related to the Property.

Copies of relevant documents are provided in Appendix E. A summary of the findings for the Property from these documents is as follows:

Current USTs --

Permits from 1998 indicate that Foss Environmental installed two 12,000-gallon underground fuel storage tanks, one gasoline and one diesel. These USTs are located on the 1400 block of San Francisco Avenue, between 14th Street and Cowles Street. These tanks were observed during the site inspection at the fleet fueling station on the Property.

Historic USTs --

Long Beach Fire Department files contained abundant information regarding the storage of hazardous materials including current and historic USTs, aboveground storage tanks (ASTs) and miscellaneous flammable and combustible materials. Specific records related to these USTs are discussed below. A summary of this information is provided in the Historical Use Summary section of this report.

Two 10,000-gallon Gasoline and Diesel USTs at 1725 San Francisco Avenue --

Information on these USTs is provided in the following documents:

McLaren Hart, UST Removal Report dated January 26, 1999 – This report relates to the removal of two 10,000-gallon fuel tanks (one unleaded and one diesel) and one 1,000-gallon unused tank. Since the 1,000-gallon tank was reportedly never used, no soil sampling was conducted. This 1,000-gallon unused tank was shown as being located 682 feet south of Esther Street and 10 feet east of the western property line; this is in the area of 16th Street on the Property.

A map indicates the two 10,000-gallon USTs were located 135 feet south of Esther Street (APN 7271-016-900). Soil samples were collected and analyzed from beneath the two 10,000-gallon USTs, along the diesel product line and beneath the gas and diesel dispensers; and two samples were taken from the spoils piles. One of the samples from beneath the diesel UST and both of

the samples from beneath the dispensers contained elevated concentrations of gasoline and diesel fuel constituents (e.g., up to 11,400 mg/kg [milligrams per kilogram, equivalent to parts per million or ppm]) of diesel-range hydrocarbons).

McLaren Hart, Additional Sampling Results Report dated February 1, 1999 – This report indicates that excavation and confirmation sampling was conducted in the three areas where elevated concentrations of petroleum hydrocarbons were detected during the removal of the 10,000-gallon USTs (discussed above). Approximately 31 cubic yards (cy) of impacted soil was removed from the west end of the diesel UST excavation to a depth of 18 feet below grade, and 21 cy of impacted soil was removed from beneath the dispensers to a depth of 6 feet below grade. Confirmation samples collected from the excavations did not contain detectable concentrations of gasoline- or diesel-range hydrocarbons; MTBE was the only fuel-related volatile organic compound detected (at 32 ug/kg [micrograms per kilogram], equivalent to parts per billion or ppb).

Long Beach/Signal Hill Joint Powers Agency "No Further Action" Letter dated March 25, 1999 – This letter indicates that "no further action" was required for four tanks: two 10,000-gallon, one 1,000-gallon, and one 500-gallon storage tank. The two 10,000- and one 1,000-gallon USTs appear to be related to those identified in the McLaren Hart reports discussed above. The 500-gallon UST was not included in the McLaren Hart reports; further information regarding a 500-gallon UST is provided below.

UST Testing And Certification Document dated September 6, 1995 – This document indicates that two 10,000-gallon tanks, located at 1725 San Francisco Avenue, were tested for releases and "passed" with respect to leak detection.

UST Permit Application (Forms A and B) dated January 5, 1999 – These permits indicated that five tanks were present on the Property. Two of the "USTs" were not identified; the other three USTs were identified on the Form B permits as:

- 10,000-gallon regular unleaded UST installed in 1966
- 10,000-gallon diesel UST installed on November 5, 1959
- 1,000-gallon never used UST installed on July 19, 1988; with a note indicating that this UST was "originally meant for solvent."

According to the permits, the tanks are associated with the City of Long Beach Public Service Maintenance Yard and were located at 1725 San Francisco Avenue. An address of 1601 San Francisco is listed on the Form A permit under "facility/site information and address." This indicates that a separate mailing address of 1601 San Francisco Avenue was being used for the Maintenance Yard at that time.

Fire Prevention Plan Worksheet dated January 6, 1999 – This document indicated that Foss Environmental removed three tanks from 1725 San Francisco Avenue. The sizes of the tanks

were not indicated; however, based on available information, it would appear that these three tanks are those discussed in the above-mentioned reports from McLaren Hart.

1,000-gallon Unused Kerosene/Solvent UST --

As discussed above, one of the USTs removed by Foss Environmental and McLaren Hart in 1999 was a 1,000-gallon "unused" tank. A "New Tank Installation" form dating from 1988 for 1725 San Francisco indicates that a 1,000-gallon kerosene tank was to be installed. A Plot Plan (not accompanied by any permit) showed a 1,000-gallon "solvent" UST at 1725 San Francisco Avenue; however, no date was indicated on the plan and buildings depicted on the map did not correspond to current building configurations, so the location of the tank could not be determined.

However, as previously discussed, this UST was apparently removed by Foss Environmental and McLaren Hart. Since the UST was reportedly never used, no soil sampling was conducted. This UST was located 682 feet south of Esther Street and 10 feet east of the western property line, in the area of 16th Street. As discussed above, the Long Beach/Signal Hill Joint Powers Agency's "No Further Action" letter, dated March 25, 1999, included a 1,000-gallon capacity UST. Based on available information, it would appear that these documents all apply to the same UST.

500-gallon Kerosene UST --

A Bureau of Fire Prevention inspection notice, dated July 6, 1988, indicated the removal of one 500-gallon kerosene UST at 1725 San Francisco Avenue, for the "San Francisco Yard (City of Long Beach)." The notice indicated that one soil sample should be collected at a depth of three to five feet beneath the tank.

Additional information regarding this tank was identified in the records of the Long Beach Department of Health and Human Services (DHHS) and Los Angeles Regional Water Quality Control Board (RWQCB) files, as discussed later in this report.

550-gallon Gasoline UST --

An "UST Unauthorized Release (Leak)/Contamination Site Report" dated May 29, 1996 indicated that on August 30, 1995 it was discovered that an unknown quantity of gasoline leaked from a 30-plus year old 550-gallon UST at 901 West Anaheim Street. This address corresponds with the southern portion of the Property, formerly occupied by the City Tow Yard. The report indicated that the City of Long Beach purchased the land, found and removed the tank, and subsequently discovered the tank leak.

Additional information regarding this tank was identified in DHHS and RWQCB files, as discussed later in this report.

Motor Oil UST --

An UST Unauthorized Release (Leak)/Contamination Site Report dated August 4, 1995 indicated that 110 gallons of new motor oil was released due to a piping leak that occurred at 1725 San Francisco Avenue. The report indicated that preliminary assessment was underway; no further documentation regarding this release was identified by SCS. Since 1725 San Francisco was used as a mailing address for the City Service Yard, the actual location of this "unauthorized release" is unknown.

10,000-gallon Diesel UST --

A "Flammable Liquids Permit," issued on January 10, 1969, for the Public Service Yard at 1725 San Francisco Street, indicated that a 10,000-gallon diesel UST was to be installed on the Property. The permit also indicated that including this tank; there were a total of two tanks (with 20,000-gallons of capacity) and one pump at this address. Another permit application for a 10,000-gallon diesel fuel UST, for the City Public Service Yard at 1725 San Francisco Avenue, was approved on March 29, 1976; this permit may have been related to an existing UST. No further information was found regarding the location or disposition of these tanks. Either or both of these records may be related to the diesel UST removed by McLaren Hart in 1999.

However, there is a discrepancy with regarding to installation date. The 10,000-gallon UST removed by McLaren Hart in 1999 was reportedly installed in November 1959.

Gasoline UST --

A sketch map dated September 20, 1979 was identified with the address of 1601 San Francisco Avenue. Notes on the map indicated that this was a City of Long Beach project related to the installation of vapor recovery line for an existing gasoline tank. No further information related to this tank was identified. No details were present on the map to indicate the size or location of the tank. This record may be related to the 550-gallon gasoline UST at 901 Anaheim, or the 10,000-gallon unleaded gasoline located at 1725 San Francisco, reportedly installed in 1966 and removed in January 1999.

Miscellaneous UST Records --

A letter from the Department of Health and Human Services, dated October 18, 1995, indicated that they had received tank closure information that indicated a discharge of hazardous material at 901 West Anaheim Street, with a request for a "Site California Permit and an Initial Site Characterization Report." A subsequent letter from the Long Beach/Signal Hill Joint Powers Agency, dated April 2001, indicated that groundwater contamination was present with respect to the address of 901 West Anaheim Street. Additional information regarding the "901 Anaheim" tank was identified in DHHS and RWQCB files, as discussed later in this report.

Aboveground Hazardous Materials Storage --

Aboveground Tar Emulsion Tanks --

An application to remove or abandon storage tanks, dated January 1990, indicated that two aboveground tanks were removed from 1601 San Francisco Avenue by Atlas Allied Inc. According to an attached Plot Plan, the tanks that were removed were similar to the tar emulsion tanks that are currently present on the Property. Furthermore, the tanks appeared to be located in the same area, between Esther Street and 17th Street, along the western border of the Property. Based on available information, it would appear that two tar emulsion tanks were removed in 1990 and replaced by two new tar emulsion tanks. No significant environmental impact to the Property is anticipated from these tanks.

Flammable and Combustible Liquids --

City of Long Beach Fire Department documents indicated that various other flammable and combustible materials, including "solvent," xylenes, lacquer thinner, and propane were "stored, handled, used, or sold" on the Property at 1610 San Francisco Avenue.

File Reviews at the Los Angeles RWQCB and Long Beach DHHS

Reviews of files at the Long Beach Department of Health and Human Services (DHHS) and Los Angeles Regional Water Quality Control Board (RWQCB) were conducted on November 23 and December 2, 2004, respectively. Copies of relevant information obtained from the file reviews are provided in Appendix E. A summary of relevant environmental information obtained from these file reviews is presented below:

- A DHHS "Haz Waste Worksheet" dated November 11, 1987, indicates that 1,1,1-TCA contaminated with asphalt was stored in 55-gallon drums in the area of the Engineering Laboratory at 1475 San Francisco Avenue. Other documents from November and December 1987 for the Physical and Chemical Testing Lab (1475 San Francisco Avenue) indicate that four 55-gallon drums of 1,1,1-TCA are disposed of annually.
- On July 6, 1988 a 500-gallon kerosene UST was removed by Marine Contractors from a location shown as the southwest corner of San Francisco Avenue and Esther Street (1725 San Francisco Avenue), within or beneath Street Division Storage Building. One undertank sample was analyzed for total recoverable petroleum hydrocarbons (TRPH) using EPA Method 418.1; the lab result for this sample was reported as 16,000 ug/g (micrograms per gram, equivalent to parts per million). Notes in the file indicated that the assessment of this area was to be completed at the same time as two existing USTs were removed on the same parcel (northernmost of the 6 contiguous lots). A note dated March 25, 1999 on the City of Long Beach Environmental Health Underground Tank Program Tracking System summary states:

“Based on present closure guidance for low risk fuel contamination site fact sheet issued by the California Regional WQCB, Los Angeles Region, this site is low risk therefore no further action is required.”

Based on this information, no remediation of impacted soils was conducted.

- DHHS records indicate that crushing of mercury and sodium street lights in a dumpster was conducted at the Street Lighting Division (1601 San Francisco Avenue); a water spray used to control dust caused water runoff from the dumpster. It is possible that mercury and other metals incorporated into the runoff have impacted the area.
- Regulatory records indicate that a 550-gallon gasoline UST at “901 Anaheim” was actually located in the 14th Street right-of-way 146 feet west of San Francisco Avenue and immediately north of the Tow Yard at 901 Anaheim. This UST was removed by Maness Environmental on August 30, 1995. Two soil samples were collected and analyzed during the UST removal. Sample 1C-8 (presumably 8 ft bgs) contained 7,500 mg/kg of total petroleum hydrocarbons (TPH using EPA Method 8015M) and benzene, toluene, ethylbenzene and xylene (BTEX) concentrations of 22, 17, 98 and 470 mg/kg, respectively. Sample SP-1 (stockpile) did not contain detectable concentrations of TPH, but did contain 0.013 mg/kg of xylenes.

Subsequently, EPICS International conducted an investigation that resulted in a report dated January 31, 1996. Six borings were drilled to groundwater at about 8 to 8.5 feet below grade. Soil and/or groundwater samples from each boring indicated that soils and groundwater were impacted at least 20 to 30 feet from the UST location to the north, south and east. Soils were impacted with TPH as gasoline (TPHg) at concentrations as high as 5,500 mg/kg, benzene to 27 mg/kg, toluene to 48 mg/kg, ethylbenzene to 110 mg/kg, and xylenes to 540 mg/kg. Grab samples of groundwater were impacted with TPHg up to 3,400 mg/L, TPHd up to 600 mg/L, benzene up to 18.8 mg/L, toluene to 42.4 mg/L, ethylbenzene to 108 mg/L, and xylenes to 703 mg/L. From this data, it is likely that free product is present floating on the groundwater. None of the samples were analyzed for fuel oxygenates such as MTBE.

In a letter dated April 2, 2001, DHHS referred this case to the RWQCB. The Reynolds Group (TRG) prepared a workplan dated November 15, 2001 which was submitted to the RWQCB. The TRG Workplan was approved by the RWQCB in a letter dated February 19, 2002. No other information regarding this site was available in regulatory files.

- DHHS records included documents and references related to the use and storage of hazardous wastes such as paints, solvents, 55-gallon drums, etc. Where these areas could be identified, they have been included on Figures 4 and 5 of Appendix A.

- Permits for two groundwater monitoring wells for Los Angeles County and one well for Long Beach Public Works were identified for the Property or immediately surrounding area in 1994 and 1995. The status of these wells is unknown.

Interviews with Knowledgeable Personnel

SCS contacted Larry McNerny, a Supervisor with the City of Long Beach Towing Yard, regarding historical Property use. Mr. McNerny indicated that he first worked at the tow yard in 1982, soon after the city acquired the southern portion of the Property from a lumber mill and developed the tow yard. The city tow yard was in operation until 1999, and has been used for equipment and vehicle storage since then. Tow yard operations included vehicle maintenance and an impound yard. The only UST that Mr. McNerny was aware of is reportedly located immediately north of the Tow Yard (APN 7271-007-902). This appears to be the "901 Anaheim" UST discussed above. Mr. McNerny stated that the tow yard never used this UST, and that he was unaware of the size or contents of the UST.

During the site inspection on May 24, 2004, Mr. Hough commented that the western portion of the city's Public Service Yard (along the Los Angeles River) is higher in elevation and that this is due to the burial of 1933 earthquake debris.

During the site inspection on August 10, 2004, Mr. Greg Keys, Supervisor for the Structural/Anti-Graffiti operations at the Public Service Yard, indicated that the only underground tanks he had knowledge of during his approximately 20 years of working on the Property were the two fuel tanks currently located on the Property at the fleet fueling station (APN 7271-008-900) and two fueling tanks that were removed from the northern portion of the Property (APN 7271-016-900) by McLaren Hart in 1999.

During the site visit Mr. Keys also provided information pertaining to the clarifiers on the Property. According to Mr. Keys, the clarifiers are three-stage clarifiers and are used to clarify run-off water from vehicle cleaning and paint equipment cleaning. Uniform hazardous waste manifests (dated July 6, 2004) from the service company, Patriot Environmental, which were produced by Mr. Keys, indicated the removal of "mixed paints and thinners – waste paint related materials" and "non-RCRA hazardous waste liquid – clarifier waste/sludge." Copies of the manifests are provided in Appendix C.

Historical Use Summary

Historical information indicates that portions of the Property were initially developed for commercial use as early as 1926, and have been used for commercial or industrial purposes since that time. Superior Laundry was identified in city directories on the Property in 1926. A veterinarian and kennels occupied a portion of the Property from at least 1929 through 1948. Lumber and building material companies (Fickling and Blue Diamond) occupied part of the Property from at least 1932 until the early 1980s, when records indicate that a portion of the Property was redeveloped with the City of Long Beach Tow Yard. The city tow yard was in

operation until 1999; and that portion of the Property has been used for equipment and vehicle storage since that time. At least a portion of the Property appears to have been utilized by the City of Long Beach, as a "municipal garage," since as early as 1926. Various other city operations, such as a chemical laboratory and a machine shop have existed on the Property from as early as 1940 to present. The southwestern portion of the Property was occupied by De Forest Avenue in 1963 and possibly as early as 1953 or earlier. City Tow Yard personnel indicated that the western portion of the Property, somewhat elevated with respect to the rest of the Property, is likely fill material, which may contain debris from the 1933 earthquake.

Superior Laundry was identified on the Property at 1317 San Francisco Avenue in 1926. It is possible that this laundry conducted dry cleaning operations. Any dry cleaning operation in the 1920s would very likely have used a petroleum-based solvent (gasoline or Stoddard), and dry cleaning operations using petroleum products were, in SCS's experience, unlikely to have resulted in any significant environmental impact to the parcels they occupy. In summary, the presence of a "laundry" or possible dry cleaning operation in 1926 does not represent an environmental concern for the Property.

Long Beach Fire Department files contained abundant information regarding the storage of hazardous materials including current and historic USTs, aboveground storage tanks (ASTs) and miscellaneous flammable and combustible materials. A summary of this information indicates the following:

- There are two 12,000-gallon USTs are currently in use, one gasoline and one diesel. At this time, there is no evidence in LBFD records that leaks or spills have occurred from these USTs.
- Historic USTs included the following:
 1. 10,000-gallon unleaded gasoline, reportedly installed in 1966 and removed in January 1999. Regulatory closure received from Long Beach/Signal Hill Joint Powers Agency (JPA) in the "No Further Action" Letter dated March 25, 1999.
 2. 10,000-gallon diesel, reportedly installed on November 5, 1959 and removed in January 1999. Regulatory closure received from the JPA in the "No Further Action" Letter dated March 25, 1999.
 3. 1,000-gallon unused UST, originally meant for solvent/kerosene, installed on July 19, 1988 and removed in January 1999. Regulatory closure received from JPA in the "No Further Action" Letter dated March 25, 1999.
 4. 500-gallon kerosene UST, removed in July 1988. The location of this UST was at the southwest corner of San Francisco Avenue and Esther Street. One undertank soil sample contained 16,000 parts per million of hydrocarbons. A note dated March 25,

1999 on the City of Long Beach Environmental Health Underground Tank Program Tracking System summary states:

“Based on present closure guidance for low risk fuel contamination site fact sheet issued by the California Regional WQCB, Los Angeles Region, this site is low risk therefore no further action is required.”

Based on this information, no remediation of impacted soils was conducted.

5. 550-gallon gasoline UST – An “UST Unauthorized Release (Leak)/Contamination Site Report” dated May 29, 1996 indicated that on August 30, 1995 it was discovered that an unknown quantity of gasoline leaked from a 30 plus year old UST at 901 West Anaheim Street. This UST was removed by Maness Environmental on August 30, 1995, from a located in the 14th Street right-of-way 146 feet west of San Francisco Avenue and immediately north of the Tow Yard at 901 Anaheim. Soil and groundwater impacts were confirmed in investigations of the area. In a letter dated April 2, 2001, DHHS referred this case to the RWQCB. The Reynolds Group (TRG) prepared a workplan dated November 15, 2001 which was submitted to the RWQCB. The TRG Workplan was approved by the RWQCB in a letter dated February 19, 2002. No other information regarding this site was available in regulatory files.

The following records may be related to one or more of the USTs discussed above, or may be related to other historic USTs on the Property:

- Motor Oil UST – An UST Unauthorized Release (Leak)/Contamination Site Report dated August 4, 1995 indicated that 110 gallons of new motor oil were spilled from piping at 1725 San Francisco. No additional information regarding the location, investigation or regulatory status of this “unauthorized release” was identified in LBFD records.
- 10,000-gallon diesel UST – A “Flammable Liquids Permit,” issued on January 10, 1969, for the Public Service Yard at 1725 San Francisco Street, indicated that a 10,000-gallon diesel UST was to be installed on the Property. The permit also indicated that including this tank; there were a total of two tanks (with 20,000-gallons of capacity) and one pump at this address. Another permit application for a 10,000-gallon diesel fuel UST, for the City Public Service Yard at 1725 San Francisco Avenue, was approved on March 29, 1976; this permit may be related to an existing UST. No further information was found regarding the location or disposition of these tanks. Either or both of these records may be related to the diesel UST removed by McLaren Hart in 1999. However, there is a discrepancy with regard to the installation date; the 10,000-gallon UST removed by McLaren Hart was reportedly installed in November 1959.
- Gasoline UST – A sketch map dated September 20, 1979 was identified with the address of 1601 San Francisco Avenue. Notes on the map indicated that this was a City of Long Beach project related to the installation of vapor recovery line for an existing gasoline

tank. No further information related to this tank was identified. No details were present on the map to indicate the size or location of the tank. This record may be related to the 550-gallon gasoline UST at 901 Anaheim, or the 10,000-gallon unleaded gasoline located at 1725 San Francisco, reportedly installed in 1966 and removed in January 1999.

The following additional recognized environmental conditions were identified from historical information:

- **Fill Material** – City personnel indicated that fill material appears to have been placed on the western portion of the Property; the source of this material is unknown, but may include debris from the 1933 earthquake. Building debris from 1933 may contain asbestos, lead-based paint, or other issues of potential environmental concern.
- **Possible releases of waste oils, chemicals, and solvents**, may have resulted from historical operations on the Property (e.g., chemical storage and use areas, paint shop, chemical laboratory, machine shop, etc.).

Adjacent sites, historically including: truck parking, vacant lots, a liquor market, a trucking company, a food facility, a meat refrigeration site, offices, truck services, plumbing supplies, a machine shop, tourist court units, an electric appliance warehouse, Adhor Milk Farms, a vacant building, an auto court, dwellings, and the Los Angeles River Flood Control Channel, are not anticipated to pose an environmental concern for the Property.

REGULATORY RECORDS REVIEW

Local regulatory agencies and other sources were contacted in an effort to identify any known or suspected contamination sites or incidents of hazardous waste storage or disposal which might have resulted in soil or groundwater contamination within a one-mile radius of the Property. Within the City of Long Beach, the Long Beach Fire Department generally acts as the lead enforcement agency for underground storage tank compliance and removals. If soil or groundwater contamination is suspected, the Long Beach Department of Health and Human Services generally acts as the lead enforcement agency for subsequent investigations. However, if groundwater has been affected, the Los Angeles Regional Water Quality Control Board (RWQCB) generally becomes the lead agency for contamination characterization and cleanup.

Regulatory Database Sites

In addition, a database search for sites listed on various federal and state databases within one mile of the Property was obtained from EDR Environmental Information. A description of each of the databases searched is included in the report, which is attached as Appendix E. The EDR databases include NPL, US EPA CERCLIS, State CERCLIS, CORRACTS, LUST, CA SLIC, Calsites, SWLF, Cortese, Border Zone Properties, ERNS, and Toxic Pits. Any sites included on these lists within 0.25 miles of the Property are discussed in the following text. As a general rule, sites beyond 0.25 miles are not anticipated to impact a site significantly. Any sites beyond

0.25 miles with a high potential to impact the Property are also discussed. (Please note: the distances and directions listed in this report have been field verified and might not always match those in the EDR report.)

The EDR databases also include TSD facilities, hazardous waste generators, HAZNET, FINDS, SQGs, LQGs, USTs, HIST UST, RCRA violations, and TRIS facilities with toxic chemical releases (generally in accordance with permitting requirements - into the air, water, or land as reported under SARA Title III). These sites use or store hazardous materials and thus may pose a potential problem in the event of a spill or leak. However, unless these sites also appear in an agency list of contaminated sites, there is no evidence of any problems at this time. Therefore, sites on these lists will not be discussed unless on or in close proximity to the Property.

Please refer to Appendix F for further information on these sites.

Property Listings--

The Property is variously identified in the EDR database report as the Vehicle Tow Yard, Long Beach City Tow Yard, City of Long Beach Towing Operations, Public Service Yard, City of Long Beach Public Works, City of Long Beach Public Service Yard, Long Beach City Public Service Yard, City of Long Beach Testing Lab, Public Service Transfer Station #2, and City of Long Beach; with addresses of 901 and 929 West Anaheim (EDR locations A1-A4, pgs 6-9) and 1475, 1601 and 1725 San Francisco Avenue (EDR locations O58-O63, pgs 55-61).

The Property is identified on the HAZNET, Cortese, LUST, RCRIS-SQG, FINDS, SWF/LF, EMI, and UST databases:

Listing	Address	Owner	Comments
A1 Cortese	901 Anaheim	Vehicle Tow Yard	No information on the nature of the listing, however, the Cortese list consists predominantly leaking UST sites. See below.
A2 LUST	901 W. Anaheim St.	Long Beach City Tow Yard	An UST was found after the City of Long Beach purchased the land. A gasoline release was discovered during tank removal in August 1995. The information provided in the database corresponds to the 550-gallon UST previously discussed.

Listing	Address	Owner	Comments
A4 HAZNET	901 West Anaheim	City of Long Beach Towing Operations	This listing is related to the removal of the following wastes: organic solids, oil-containing waste, and aqueous solution with organic residues.
A3 UST	929 West Anaheim	City of Long Beach	<u>UST</u> This address corresponds to the same parcel as 901 Anaheim and is likely related.
O62 RCRIS-SQG, FINDS	1475 San Francisco	City of Long Beach Testing Lab	<u>RCRIS</u> Operations on the Property generated small quantities of hazardous waste (e.g., solvents, etc.). <u>FINDS</u> Resource Conservation and Recovery Act Information System
O59 HAZNET	1601 San Francisco	City of Long Beach Public Works	<u>HAZNET</u> Listing related to the manifesting of asbestos-containing waste, unspecified solvent mixture waste, waste oil and mixed oil, and unspecified oil-containing waste.
O61 RCRIS-SQG, FINDS	1601 San Francisco	City of Long Beach Public Service Department	<u>RCRIS</u> Operations on the Property generated small quantities of hazardous waste (e.g., solvents, etc.). <u>FINDS</u> Resource Conservation and Recovery Act Information System

Listing	Address	Owner	Comments
O63 SWF/LF, EMI	1601 San Francisco	Public Service Transfer Station #2	The SWF/LF listing is related to the limited-volume transfer station operations; green materials, mixed municipal – 1,000 tons per year. <u>EMI</u> National Emissions Inventory.
O58 Cortese, LUST	1725 San Francisco	Public Service Yard	<u>LUST</u> Release Date: 8/4/95 Piping failure Affected soil only Substance type not identified. No closure reported <u>Cortese</u> No information on the nature of the listing.
O60 UST	1725 San Francisco	City of Long Beach Public Service Yard	<u>UST</u> Two tanks on Property.

All of the Cortese, UST and LUST database listings appear to relate to underground storage tanks that have been previously discussed in this report.

The HAZNET database indicated that organic solids, oil-containing wastes, and aqueous solutions with organic residues were removed from 901 West Anaheim under manifest, and that asbestos containing waste, unspecified solvent mixture waste, waste oil and mixed oil, and unspecified oil-containing wastes were removed from 1601 San Francisco Avenue under manifest. These wastes were likely the result of vehicle maintenance operations, construction activities, and painting operations on the Property.

The RCRIS-SQG database, which is a list of sites that generate, transport, store, treat and/or dispose of small quantities of hazardous waste, did not provide any information pertaining to the nature of the materials generated on the Property; however, the entries indicated that no violations were found.

The FINDS database, which lists other databases that a site is included in, indicated that the Property is listed on the National Emissions Inventory and the Resource Conservation and Recovery Act Information System databases. This listing is likely due to historic or on-going operations such as the paint booth, fuel station, etc.

The solid waste information system database (SWF/LF) typically contains an inventory of active, closed, and inactive landfills or disposal facilities. The listing for the Property indicated that a limited volume (up to 1,000 tons per year) transfer operation, which included green materials and mixed municipal waste, existed at 1601 San Francisco Avenue. Since no waste material was permanently stored at this facility, no significant environmental impact is anticipated with respect to this listing.

The Emissions Inventory Database (EMI) indicates facilities whose emissions data have been collected by various air pollution agencies. No information was given regarding the nature of the data that was collected for the Property. It is likely this listing was related to the paint booth and/or fueling station.

Other Database Sites--

The EDR database lists the following sites within a one-mile radius of the Property. Some sites may be listed on more than one database. (Please note: LUST sites that are within 1/2-1 mile of the Property may not be reported unless present on at least one additional database).

Database	Number of Sites		
	0 – 1/4 miles	1/4 – 1/2 miles	1/2 - 1 mile
US EPA National Priority List (NPL)	0	0	0
US EPA RCRA Corrective Actions (CORRACTS)	0	0	1
California Superfund (SPL)	0	0	0
US EPA CERCLIS (sites under review for inclusion of the NPL)	1	0	0
California equivalent CERCLIS (SCL)	0	0	0
California Leaking Underground Storage Tanks (LUST)	7	17	--
California Solid Waste & Landfill Facilities (SWLF)	1	0	--
California Properties with Deed Restrictions	0	--	--
California Properties with Hazardous Waste (Cortese)	8	16	--

Database	Number of Sites		
	0 – 1/4 miles	1/4 – 1/2 miles	1/2 - 1 mile
California Registered Underground Storage Tanks (UST)	20	--	--
California State Spills List	4	2	--
US EPA Hazardous Waste Generators	11	--	--

According to the EDR database, numerous sites within 0.25 miles of the Property have had releases of substances including hydrocarbons and volatile organic compounds, and groundwater in the area has been impacted. Based on this information, it is possible that impacted groundwater from these sites has migrated beneath the Property.

Unmappable or Orphan Sites--

A total of 154 unmappable sites were identified in the EDR Report according to their zip code. Unmappable sites cannot be plotted due to inaccurate or incomplete addresses. Based on review of the provided data, including the likely location of the unmappable sites in relation to the Property, it appears unlikely that the unmappable sites have adversely affected the environmental condition of the Property.

Landfills

A review of the Major Waste Systems Map (June 1972, revised August 1976) was conducted to locate any landfills or transfer stations within a one-mile radius of the Property. No landfills or transfer stations were observed to be within one mile of the Property according to the Major Waste Systems Map.

A copy of the Major Waste System Map that includes the Property is included in Appendix D.

Oil and Gas Wells

SCS reviewed relevant information from the California Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR) regarding oil and gas exploration activities in this portion of Long Beach. DOGGR maps (Nos.131 and 127) indicated that numerous oil wells are present approximately 300 feet west and southwest of the Property across the Los Angeles River Flood Control Channel. Since these wells are on the opposite side of the river, no significant environmental impact to the Property is anticipated from oil and gas exploration or production.

FINDINGS AND OPINIONS

Based on the scope of work performed, SCS finds the following:

- The Long Beach Service Yard consists of seven rectangular Los Angeles County Tax Assessor's Parcels that total approximately 689,913 square feet in area. The Property is located west of San Francisco Avenue and east of the Los Angeles River between Pacific Coast Highway and Anaheim Street in Long Beach, California. The six southern-most parcels of the Property are contiguous and include the intervening street rights-of-way, which have been incorporated into the Public Service Yard. The northern-most parcel (940 Pacific Coast Highway, APN 7271-017-900) is located on the north side of the adjacent city block, approximately 200 feet north of the other parcels.
- The Property is presently utilized for various operations performed by Long Beach Public Services (e.g. traffic management, street maintenance, and landscaping). The Property is occupied by 24 buildings, eight storage sheds, a carwash, two clarifiers, a fueling station with underground storage tanks of diesel and gasoline, four gravel bays, two aboveground tar emulsion tanks, an aboveground propane tank and several hazardous materials storage areas. The area surrounding the structures is paved, and the large open areas of the Property are utilized for storage and parking. The two clarifiers, which are utilized at a vehicle washing station and a paint equipment cleaning station, the paint spray booth and the hazardous materials storage areas are considered Recognized Environmental Concerns.
- Historical information indicates that portions of the Property were initially developed for commercial use as early as 1926, and have been used for commercial or industrial purposes since that time. Superior Laundry was identified in city directories on the Property in 1926. A veterinarian and kennels occupied a portion of the Property from at least 1929 through 1948. Lumber and building material companies (Fickling and Blue Diamond) occupied part of the Property from at least 1932 until the early 1980s, when records indicate that a portion of the Property was redeveloped with the City of Long Beach Tow Yard. The city tow yard was in operation until 1999; and that portion of the Property has been used for equipment and vehicle storage since that time. At least a portion of the Property appears to have been utilized by the City of Long Beach, as a "municipal garage," since as early as 1926. Various other city operations, such as a chemical laboratory and a machine shop have existed on the Property from as early as 1940 to present. The southwestern portion of the Property was occupied by De Forest Avenue in 1963 and possibly as early as 1953 or earlier. City Tow Yard personnel indicated that the western portion of the Property, somewhat elevated with respect to the rest of the Property, is likely fill material, which may contain debris from the 1933 earthquake.
- Superior Laundry was identified on the Property at 1317 San Francisco Avenue in 1926. It is possible that this laundry conducted dry cleaning operations. Any dry cleaning

operation in the 1920s would very likely have used a petroleum-based solvent (gasoline or Stoddard), and dry cleaning operations using petroleum products were, in SCS's experience, unlikely to have resulted in any significant environmental impact to the parcels they occupy. In summary, the presence of a "laundry" or possible dry cleaning operation in 1926 does not represent an environmental concern for the Property.

- Observations during the site inspection indicate that adjacent properties are currently occupied by: Long Beach Garage Door Co., Hydraulic and Automation Controls Co., The Food Bank of Southern California (and associated parking lot), 7-Strand, Ready Storage, BCIA Precision Casting, Graybar Distributor of Electrical and Comm/Data Products, Long Beach Seafood Co. Wholesale Outlet, Mylo's Custom Auto Body, Tacoma Express Inc., Truck Parking, Riley Marine Products, Goodwill (and associated parking lots), and Ocean Blue Environmental Services. No obvious recognized environmental concerns for the Property were identified on these adjacent sites.
- Regulatory database information identified the Property on the HAZNET, Cortese, LUST, RCRIS-SQG, FINDS, SWF/LF, EMI, and UST databases. The Cortese, LUST and UST database listings appear to relate to the current and historic UST operations, removals and cleanups. Other EDR report information indicated that wastes such as organic solids, oil-containing wastes, aqueous solutions with organic residues, asbestos containing waste, unspecified solvent mixture waste, and waste oil and mixed oil, were used on the Property. Additionally, the database report indicated that a transfer station operation formerly existed on the Property.
- Long Beach Fire Department information indicated that there are two 12,000-gallon USTs are currently in use, one gasoline and one diesel. These tanks are located on parcel 7271-008-900, between Cowles and 14th Street. At this time, there is no evidence in LBFD records that leaks or spills have occurred from these USTs.
- Historic on-site USTs included the following:
 1. 10,000-gallon unleaded gasoline, reportedly installed in 1966 and removed in January 1999. Regulatory closure received from Long Beach/Signal Hill Joint Powers Agency (JPA) in the "No Further Action" Letter dated March 25, 1999.
 2. 10,000-gallon diesel, reportedly installed on November 5, 1959 and removed in January 1999. Regulatory closure received from the JPA in the "No Further Action" Letter dated March 25, 1999.
 3. 1,000-gallon unused UST, originally meant for solvent/kerosene, installed on July 19, 1988 and removed in January 1999. Regulatory closure received from JPA in the "No Further Action" Letter dated March 25, 1999.

4. 500-gallon kerosene UST, removed in July 1988. The location of this UST was at the southwest corner of San Francisco Avenue and Esther Street. One undertank soil sample contained 16,000 parts per million of hydrocarbons. A note dated March 25, 1999 on the City of Long Beach Environmental Health Underground Tank Program Tracking System summary states:

“Based on present closure guidance for low risk fuel contamination site fact sheet issued by the California Regional WQCB, Los Angeles Region, this site is low risk therefore no further action is required.”

Based on this information, no remediation of impacted soils was conducted.

5. 550-gallon gasoline UST – An “UST Unauthorized Release (Leak)/Contamination Site Report” dated May 29, 1996 indicated that on August 30, 1995 it was discovered that an unknown quantity of gasoline leaked from a 30 plus year old UST at 901 West Anaheim Street. This UST was removed by Maness Environmental on August 30, 1995, from a located in the 14th Street right-of-way 146 feet west of San Francisco Avenue and immediately north of the Tow Yard at 901 Anaheim. Soil and groundwater impacts were confirmed in investigations of the area. In a letter dated April 2, 2001, DHHS referred this case to the RWQCB. The Reynolds Group (TRG) prepared a workplan dated November 15, 2001 which was submitted to the RWQCB. The TRG Workplan was approved by the RWQCB in a letter dated February 19, 2002. No other information regarding this site was available in regulatory files.

The following records may be related to one or more of the USTs discussed above, or may be related to other historic USTs on the Property:

- Motor Oil UST – An UST Unauthorized Release (Leak)/Contamination Site Report dated August 4, 1995 indicated that 110 gallons of new motor oil were spilled from piping at 1725 San Francisco. No additional information regarding the location, investigation or regulatory status of this “unauthorized release” was identified in LBFD records.
- 10,000-gallon diesel UST – A “Flammable Liquids Permit,” issued on January 10, 1969, for the Public Service Yard at 1725 San Francisco Street, indicated that a 10,000-gallon diesel UST was to be installed on the Property. The permit also indicated that including this tank; there were a total of two tanks (with 20,000-gallons of capacity) and one pump at this address. Another permit application for a 10,000-gallon diesel fuel UST, for the City Public Service Yard at 1725 San Francisco Avenue, was approved on March 29, 1976; this permit may be related to an existing UST. No further information was found regarding the location or disposition of these tanks. Either or both of these records may be related to the diesel UST removed by McLaren Hart in 1999. However, there is a discrepancy with regard to the installation date; the 10,000-gallon UST removed by McLaren Hart was reportedly installed in November 1959.

- Gasoline UST – A sketch map dated September 20, 1979 was identified with the address of 1601 San Francisco Avenue. Notes on the map indicated that this was a City of Long Beach project related to the installation of vapor recovery line for an existing gasoline tank. No further information related to this tank was identified. No details were present on the map to indicate the size or location of the tank. This record may be related to the 550-gallon gasoline UST at 901 Anaheim, or the 10,000-gallon unleaded gasoline located at 1725 San Francisco, reportedly installed in 1966 and removed in January 1999.

The following additional recognized environmental conditions were identified from historical information:

- Fill Material – City personnel indicated that fill material was placed on the western portion of the Property; the source of this material is unknown, but may include debris from the 1933 earthquake. Building debris from 1933 may contain asbestos, lead-based paint, or other issues of potential environmental concern. An obvious elevated area was noted during the site inspection on the northwestern portion of parcel 7271-011-900 (between 15th and Cowles Streets).
- Possible releases of waste oils, chemicals, and solvents, may have resulted from historical operations on the Property (e.g., chemical storage and use areas, paint shop, chemical laboratory, machine shop, etc.).
- Regulatory database information also indicates that numerous sites within 0.25 miles of the Property have had releases of substances including hydrocarbons and volatile organic compounds, and groundwater in the area has been impacted. Based on this information, it is possible that impacted groundwater from these sites has migrated beneath the Property.

In summary, the only parcel with **no recognized environmental concerns** is the northern-most of the seven parcels of the Property (940 Pacific Coast Highway, APN 7271-017-900); this parcel is approximately 200 feet north of the other parcels on the north side of the adjacent city block.

The remaining parcels contain one or more areas of environmental concern as shown in Figures 4 and 5 (Appendix A), including fill material containing debris from the 1933 earthquake and petroleum-related impacts to soil and/or groundwater from underground fuel storage tanks. Further, historic operations on these parcels have included vehicle and equipment maintenance, paint shop, chemical laboratory, landscaping departments, machine shop, etc. The locations and nature of these operations appears to be transitory, and it is possible that waste oils, various pesticides, oils, paint and solvents have spilled or leaked over the 70 plus years of operation.

In conclusion, SCS has performed a Phase I Environmental Site Assessment of the Long Beach Public Service Yard, located on seven city blocks bounded by West Anaheim to the south, San Francisco Avenue to the east, Pacific Coast Highway to the north, and the Los Angeles River Flood Control Channel to the west, in Long Beach, California, in general conformance with the

scope and limitations of ASTM Practice E1527-00. Based on the recognized environmental conditions discussed above, SCS recommends further investigation.

(213) 590-6651

LICENSED CONTRACTORS DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (Commencing with Section 7000) of Division 3 of the Business and Professional Code, and my license is in full force and effect.

License Class _____ License No. _____
Date 9/10/90 Contractor Kevin P. Merrill

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractors License Law for the following reason (Sec. 7031 California Business and Professional Code: Any City which requires a permit to construct, alter, improve, demolish or repair any structure prior to its issuance also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractors License Law (Ch. 9 (Commencing with Sec. 7000 of Div. 3 of the B. & P. C.)) by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars (\$500.00).)

a. I as owner of the property, or my employees with wages as their sole compensation, will do the work and the structure is not intended or offered for sale (Sec. 7034, B. & P. C.). The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If however, the building or improvements is sold within one year of completion, the owner-builder will have burden of proving that he did not build or improve for the purpose of sale.)

b. I as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.). The Contractors License Law does not apply to an owner of contracts for such projects with a Contractors License pursuant to the Contractors License Law.)

c. I am exempt under Sec. _____, B. & P. C. for this reason _____

Date _____ Owner _____

IMPORTANT

Application is hereby made to the Superintendent of Building and Safety for a permit subject to the conditions and restrictions set forth on the front face of this application.
1. Each person upon whose behalf this application is made and each person at whose benefit work is performed under or pursuant to any permit issued as a result of this application agrees to and shall indemnify and hold harmless the City of Long Beach its officers, agents and employees from any liability arising out of the issuance of any permit from this application.
2. Any permit issued as a result of this application becomes null and void if work is not commenced within ONE HUNDRED EIGHTY (180) DAYS from date of issuance of such permit.

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure or a certificate of worker's compensation insurance or a certified copy thereof.

Policy No. _____ Company _____
Certified copy is on file with the Department of Planning and Building.
Date 9/10/90 Applicant Kevin P. Merrill

CERTIFICATE OF EXEMPTION FROM WORKER'S COMPENSATION INSURANCE
I certify that in the performance of the work for which this permit is issued I shall not employ any person in any manner so as to become subject to the Worker's Compensation Laws of California.

Date _____ Applicant _____

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to worker's Comp. provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

I hereby state that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3807, Civ. C.).

Lender's Name _____
Lender's Address _____

I certify that I have read this application and state that the above information is correct. I agree to comply with all City and State laws relating to the building construction, and hereby authorize representatives of this City to enter upon the above mentioned property for inspection purposes.

Signature of Owner or Contractor _____

Order's Number	14-308
No.	20
Permit Number	1-3071
Date Received	11-23-43
Date Issued	12-27-43

To the Department of Engineering of the City of Long Beach:

Application is hereby made to the Department of Engineering of the City of Long Beach, through the office of the Building Inspector, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is subject to the following conditions which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the granting of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Long Beach.

Third: That the granting of the permit does not affect or prohibit any claim of title to, or right of possession to, the property described in such permit.

(Use Ink or Indelible Pencil)
DESCRIPTION OF PROPERTY

Lot No. 7-8-9-10-11

To the Department of Building and Safety of the City of Long Beach:

Application is hereby made to the Department of Building and Safety of the City of Long Beach, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure thereon described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Long Beach.

Third: That the granting of the permit does not effect or prejudice any claim of title to, or right of possession in, the property described in such permit.

LICENSED CONTRACTORS DECLARATION		WORKER'S COMPENSATION DECLARATION	
I hereby affirm that I am licensed under provisions of Chapter 8 of the California Business and Professions Code, and my license is in full force and effect. Licensee Class: _____ License No: _____ Date: _____ Contractor: _____ OWNER-BUILDER DECLARATION I hereby affirm that I am exempt from the Contractors License Law for the following reason (Sec 7031 California Business and Professions Code: Any City which requires a permit to construct, alter, improve, demolish or repair any structure prior to its issuance also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractors License Law (C.B.P.C.) Chapter 8 of Div 3 of the B. & P. C.) Any violation of Sec 7031 & any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars (\$500.00). I am owner of the property, or my pre-employees with wages as their sole compensation will do the work and the structure is not intended or offered for sale (Sec 7044, B. & P. C.). The Contractors License Law does not apply to an owner of property who builds or improves thereon, provided that work improvements are not intended or offered for sale. However, the building or improvements is sold within one year of completion, the owner-builder will have burden of proving that he did not build or improve for the purpose of sale. I am owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec 7044, B. & P. C.). The Contractors License Law does not apply to a person who contracts for such projects with a Contractor's License pursuant to the Contractors License Law. I am exempt under Sec. _____ B. & P. C. of this section. Signature: _____ Date: _____ WARNING: Application is hereby made to the Superintendent of Building and Safety for a permit subject to the conditions and restrictions set forth in the first pages of this application. 1. Each person upon whose behalf this application is made and each person at whose behalf work is performed under or pursuant to any permit issued as a result of this application agrees to and shall indemnify and hold harmless the City of Long Beach its officers, agents and employees from any liability arising out of the issuance of any permit from this application. 2. Any permit issued as a result of this application becomes null and void if work is not commenced within ONE HUNDRED EIGHTY (180) DAYS from date of issuance of such permit.		I have and will maintain workers' compensation insurance as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance policy no: Carrier: <u>ANY POLICY</u> Number: _____ (This Section need not be completed if the permit is for one known person.) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall furnish benefits with date provisions. Warning: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS, IN ADDITION TO THE COST OF COMPENSATION DAMAGES AS PROVIDED FOR IN SECTION 3700 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES. I hereby certify that there is a construction; leading agency for the performance of the work for which this permit is issued (Sec. 2607, P.C.). Owner's Address: _____ I certify that I have read this application and state that the above information is correct and agree to comply with all City and State laws relating to the building construction and hereby authorize representatives of this city to enter upon the above mentioned property for inspection purposes.  Applicant is hereby made to the Department of Engineering of the City of Long Beach, through the office of the Building Inspector, for a building permit in accordance with the Ordinance and for the purpose hereinafter set forth. This application is made subject to the following conditions which are hereby agreed to by the undersigned applicant and which shall be deemed conditions running into the essence of the permit:
 First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.
 Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Long Beach.
 Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

(Use Ink or Indelible Pencil)
 DESCRIPTION OF PROPERTY

Lot No. **15-14-17-18-19-20-21-22-23-24**

Block **3** Tract **Seabright**
 Owner's Name **Arizona Trust A. Way Co.** Owner's Address **1756 Santa Fe Ave**
 Contractor's Firm Name **Alphie J. Wiggins** State License No. **35613**
 Contractor's Address **1221 Penn St** City License No. **38866**
 Proposed Use of Building or Structure **Shop** No. of Families..... No. of Rooms.....

LOCATION OF JOB
 No. **1630** **San Francisco Ave** Street

VALUATION OF PROPOSED WORK "Value" of a Building Shall Be the Estimated Cost to Replace the Building in Kind. **Shop 3000**

Architect **J. H. Davis** State Certificate No.
 Engineer **J. H. Davis**

Any other buildings on lot? **No** How used..... Minimum distance from proposed new building.....

Size of proposed building **49** x **61** feet. **2440**
 Width Length Area of First Floor

Height to highest point **25** feet. Number of stories in height **6**

Material of exterior walls **Frame & Stucco** Material of Roof **Asph**

I have carefully examined and read the above application and know the same is true and correct, and that, in doing this work, all provisions of Long Beach Ordinances and State Laws will be complied with, whether herein specified or not. Also, in accordance with the Building Code, I hereby apply for a Certificate of Occupancy to be issued after all final inspections have been called for by me and have been made by the Department of Engineering.

All Applications must be filled out by the Applicant.

This application and permit is for the removal ☒ abandonment of tank(s) identified on this form, and shall only be valid and in force for a maximum of ten (10) working days from date of application.

Permittee or his authorized agent shall notify the Hazardous Materials Unit, Long Beach Health Department, Phone No. (213) 437-4822 and Bureau of Fire Prevention, Long Beach Fire Department, Phone No. (213) 435-2458 a minimum of 72 hours prior to the removal or filling of any tank(s). An official representative of these two departments shall be present at the job site to witness the removal or filling of any and all tanks. All directions made or given by these City officials shall be followed within a timely and reasonable fashion.

When any underground storage tank(s) is/are removed from the ground, the resulting excavated site shall be securely and properly covered in a timely and reasonable fashion. Any excavation shall be temporarily backfilled or enclosed by a fence with a minimum height of six (6) feet. If the foregoing security measures are not feasible, a security guard shall be provided, until the completion of the permit, by the permittee and at the expense of the permittee. The structural integrity of the tank(s) shall be maintained during removal and transport. Tank(s) removed from the ground are not permitted to remain at the site or within the City limits overnight. No temporary or permanent storage of any used hazardous or flammable liquids/materials storage tank(s) is/are permitted within the City limits of Long Beach.

The removal or filling of any tank(s) shall be in accordance with Long Beach Municipal Code, Title 18.46; California State Health and Safety Code, Division 20, Chapter 6.8; the Uniform Fire Code, Articles 79 and 80; and LBFD Fire Prevention Requirements, the 14 series.

I, THE UNDERSIGNED, HAVE READ COMPLETELY AND FULLY UNDERSTAND THE ABOVE LONG BEACH FIRE DEPARTMENT REQUIREMENTS WHICH APPLY TO THIS APPLICATION AND PERMIT. I, THE UNDERSIGNED, ATTEST TO THE BEST OF MY KNOWLEDGE, UNDER THE PENALTY OF PERJURY, THAT THE ABOVE PROVIDED INFORMATION IS TRUE AND CORRECT. I, THE UNDERSIGNED, ACCEPT THE CONDITION THAT ANY DEVIATION(S) FROM AND/OR MISINFORMATION ON THIS FORM WILL RENDER THIS APPLICATION AND PERMIT NULL AND VOID.

HAZARDOUS WASTES	I	II	
Haz. Waste Determ.		1	(A) Any amount greater than 25 spent mercury vapor lamps and/or other mercury containing lamps such as fluorescent tubes, high pressure halide lamps must be managed and disposed of as hazardous waste. (B) Determine if outlet for wastewater from crushing operation of low pressure sodium, Na, lamps is a storm drain or sewer outlet. If it is a storm drain, discontinue operation. Possibly relocate crushing operation where flow of wastewater can be directed into a sewer system. (C) Repair dumpster to provide more secure coverage from residual sodium in lamp reacting with water.

Note: Low pressure Na lamps provide for most of city of LB street lighting. Disposal is by crushing lamps in covered dumpster equipped with a H₂O spray system. This process makes Na unreactive. The pH of wastewater from exit point at dumpster is 11 & pH is 10 at about 7 feet away from dumpster.

NOTE: _____

Discussion with Diane Peebler of Waste Evaluation Unit
CA-DOTS Alternative Technology Section

① Any info on ^{disposal} low pressure Na lamps? none as of now

② Available recycler in the bay area Quick Silver
(415) 468-2000 who does both fluorescent
bulbs & low pressure Na lamps

③ Interim regulation is 25 tubes/day of fluorescent
bulbs can be thrown in regular trash [Maybe
changed due to recent TCLP because of Hg content]

④ Suggested options:

(a) Return to supplier

(b) Use recycler

Told her that present technique is to crush lamps in
presence of H_2O (to prevent ignition in trash) & then throw
crushed material into trash.

If lamp is burned out — then no more reactive Na +
possibly can be thrown in trash IF there's no other
hazardous ingredient

If lamp is not burned out — wetting w/ H_2O is to react
Na to make it unreactive but

DATE: 11-27-90 11:10 am

NOTE TO FILE

REGARDING ADDRESS: _____

NOTE: _____

Quick Silver referred Bob Roberts (818) 303-2053
for southern CA generators.

per Bob Roberts: Low Pressure Na lamps — yellow burning
does not contain Hg + therefore can be crushed
w/ water to make Na unreactive (with proper
precaution)

High Pressure Na lamps → or any lamp
that is white light contains Hg

Call PHILLIPS Light

DATE: 12-6-90

NOTE TO FILE

REGARDING ADDRESS: 1725 SAN FRANCISCO

NOTE:

per telecon with Gary Gravel - 500-2383

(1) Have contacted 5 consultants to the site
Charlottesville on 12-3-90

(2) All 5 consultants will submit proposals
to them + then they will choose

(3) QUESTION: How long will it take to
evaluate proposals + choose one,
G. Gravel said within 1-2 months

(4) REMINDER G. Gravel that before anything
can be done with the site the application for
permit must be submitted to Health Dept
He said they are aware of this + the chosen
consultant will be asked to ~~prepare~~ complete
application for DPH because they don't have
anybody in town to do it.

CALL G. Gravel on 12-6-1991
if no correspondence is received
regarding application for permit

December 10, 19090

Tom Commeau
Manager, Public Service Bureau
Dept. of Public Works
1601 San Francisco
Long Beach, CA 90806

Dear Mr. Commeau:

that need to be corrected

The following are my findings during the routine inspections conducted at the Public Service (PS) yard, 1601 San Francisco address. Some are violations of the Health and Safety Code and others are problems that need to be resolved. This can be accomplished by a commitment on management to not only provide the leadership but also provide specific ways/solutions to supervisors of each section.

- A. Transporting of waste oil to Fleet Services facility at 2801 Willow by PS personnel is illegal since PS is not a registered hazardous waste hauler. (Health & Safety Code, HSC, Sec 208, 25150 and 25159)

~~H. Put into operation immediately the vacuum system installed a year ago at Bldg. 4415 for waste solvent generated by maintenance and repair of chain saw equipments.~~

- B. Proper labeling of containers for hazardous wastes. The labels must indicate required information and must be clearly visible. (HSC Sec 208, 25159 and 25159.5)

- C. Paint contaminated sawdust, oil contaminated absorbent materials/sand and mercury containing lamps must be disposed as hazardous wastes using a registered hazardous waste hauler. (HSC Sec 208, 25141 and 25150)

- D. Material safety data sheets, MSDS, must be readily accessible to employees when they are in their work areas. (Hazardous Substances Information & Training Act 1980 Labor Code Sections 6360-6399.7)

- E. Set up guidelines for the use and management of hazardous waste manifests generated by each section. (HSC Sec 208, 25159 and 25159.5 Reference standards Title 22 California Code of Regulations 66480 thru 66484)

F + J
next day

- G* Relocate "crushing operation" for low pressure sodium lamps used for street lighting to direct wastewater generated to a sewer system. Repair or replace current dumpster to provide safer condition and efficient de-activation of lamps.

- H* Repair solvent tank located at Storage Shed #4140 to properly manage solvent used in cleaning equipment parts.

- I* Put into operation immediately the vacuum system installed a year ago at Bldg. 4415 for waste solvent generated by maintenance and repair of chain saw equipments.

Here are some suggestions:

1. Look into having the registered hazardous waste hauler contracted for Fleet Service at 2801 Willow to pick-up waste oil at this PS yard. This might be an item that need to be considered for PS budget for the coming year.

every 90 days

2. Designate an area to consolidate hazardous waste streams generated at this yard. Determine what other waste streams and how much of each type is generated. This will provide information on how to manage hazardous wastes as far as:
- (a) decision of storage location/s within the yard and appropriate procedures to follow regarding storage
 - (b) time scheduling for disposal of each waste streams
 - (c) assignment of personnel

To date, waste streams that have been identified are:

Waste oil
Paint contaminated sawdust
Oil contaminated absorbent material/sand
Waste oil
Waste solvent
Used paint filters from spray booth
Mercury vapor lamps and other mercury containing light tubes/bulbs
Asbestos (structural section)

- insert
on
1st page* ←
- F. Prepare a contingency plan for the yard. (HSC Sec 208, 25159 and 25159.5)
 - J. Repair containment structure for waste paint related materials (near Bldg. 4150)

If you have any questions or if I can be of further assistance to you, please ~~me~~ contact me at (213) 427-7421 ex 4127. All violations must be corrected immediately.

Respectfully submitted,

Cheryl S. Sandel
Hazardous Materials Specialist I

Date 1-28-71

1725 SAN FRANCISCO

Public Service

per J. Simmons → to his knowledge PS personnel still take waste oil to Fleet Service @ Willow/Tamale

→ informed J. Simmons of city's liability & embarrassment if any of PS personnel transporting waste oil to Fleet Service get into accident; PS is not registered hazardous waste hauler

→ J. Simmons will check if

- Fleet Service (FS) is a registered ^{hazardous} waste hauler & if YES, make arrangements to have Fleet Service pick up waste oil
- If FS is not registered HWH, then have contractor ^(registered) hazardous waste hauler pick up waste oil at this facility

→ How much "solidified waste oil" generated per month?
used to be done with sand but now using "Floor Dry"
EAGLE BRAND
CONTRACTOR DISPOSAL CONTROL SERVICES

Attention Mr. David McCarty.

**Subject : UNDERGROUND TANK TESTING AND CERTIFICATION AT
STREET MAINTENANCE, 1725 SAN FRANCISCO,
LONG BEACH, CA 90813.**

Dear Mr. McCarty,

In accordance with our agreement we arrived at the subject facility on 8/30/95 to test two underground tank systems, using the UST2000/P and PL-400 leak detector methods. A full system test was performed with the following results.

Tank #	Capacity / Gall.	Product Type	Underfilled Test / GPH	Ullage Test	Product line test / GPH
1	10,000	Diesel Fuel	Pass/ - 0.002307	Pass	Pass/ -0.007151
2	10,000	Reg. Unleaded	Pass/ + 0.001372	Pass	Pass/ -0.012712

The tanks and the lines were certified with test result within the State standard of -0.05 GPH. Because of almost infinite variables involved, this is intended to be a mathematical tolerance and is not the permission of the actual leakage. Based on the above criteria, we find the tank **mathematically TIGHT**.

Enclosed you will find copies of the relevant technical test printouts and worksheets. More detailed information will be promptly made available to you as soon as you will request it.

Our company values your business immensely and we hope you will call us again next year, when testing will become due.

Very truly yours

City of Long Beach
Working Together to Serve

2025
Memorandum

RECEIVED
SEP 18 1995
FIRE PREVENTION

Date: September 13, 1995

To: Thomas Hays, Inspector, Bureau of Fire Prevention

From: David McCarty, Administrative Supervisor

Subject: Underground Tank Testing, Public Works, 1725 San Francisco Avenue

Even though meetings are underway to reconstruct the San Francisco fuel site, the Fleet Services Bureau ordered the fuel tanks at this site tested for tightness to insure structural integrity. As you are well aware, the tanks at this facility are some of the oldest tanks owned by the City. With no assurance that construction of this site will begin this month integrity tests were ordered.

As the managing agency for the City's underground petroleum tank program, we were prepared to immediately close this site should the tanks have shown leakage.

The integrity tests were performed by a State licensed contractor on both 10,000 gal. fuel tanks and all product lines. The results were all positive and are enclosed for your records.

Fuel in these tanks will continue to be reconciled using the manual stick gauging method until construction of the site begins.

I would like to assure you we are committed to accomplishing every requirement established by your office.

Call if you have any questions. My number is x85410.

STATE I.D. #	COUNTY # <u>19</u>	JURISDICTION # <u>000</u>	FACILITY # <u>0000</u>	TANK # <u>000001</u>
PERMIT NUMBER	PERMIT APPROVED BY DATE		PERMIT EXPIRATION DATE	

THIS FORM MUST BE ACCOMPANIED BY A PERMIT APPLICATION - FORM A, UNLESS A CURRENT FORM A HAS BEEN FILED.
FILE THIS FORM WITH THE LOCAL AGENCY IMPLEMENTING THE UNDERGROUND STORAGE TANK REGULATIONS

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
UNDERGROUND STORAGE TANK PERMIT APPLICATION - FORM B

COMPLETE A SEPARATE FORM FOR EACH TANK SYSTEM

MARK ONLY ONE ITEM	☐ 1 NEW PERMIT	☐ 3 RENEWAL PERMIT	☐ 5 CHANGE OF INFORMATION	☐ 7 PERMANENTLY CLOSED ON SITE
	☐ 2 INTERIM PERMIT	☐ 4 AMENDED PERMIT	☐ 6 TEMPORARY TANK CLOSURE	☒ 8 TANK REMOVED

DBA OR FACILITY NAME WHERE TANK IS INSTALLED: CITY OF LONG BEACH - PUBLIC SERVICE MAINTENANCE YARD

I. TANK DESCRIPTION COMPLETE ALL ITEMS - SPECIFY IF UNKNOWN

A. OWNER'S TANK I.D.#	TANK # 2 UL# D875086	B. MANUFACTURED BY:	National Tank & Manufacturing
C. DATE INSTALLED (MO/DAY/YEAR)	11/5/59	D. TANK CAPACITY IN GALLONS:	10,000

II. TANK CONTENTS IF A-1 IS MARKED, COMPLETE ITEM C.

A. ☒ 1 MOTOR VEHICLE FUEL	☐ 4 OIL	B. ☒ 1 PRODUCT	C. ☐ 1a REGULAR UNLEADED	☒ 3 DIESEL	☐ 6 AVIATION GAS
☐ 2 PETROLEUM	☐ 50 EMPTY	☐ 2 WASTE	☐ 1b PREMIUM UNLEADED	☐ 4 GASOLINE	☐ 7 METHANOL
☐ 3 CHEMICAL PRODUCT	☐ 95 UNKNOWN		☐ 2 LEADED	☐ 5 JET FUEL	☐ 99 OTHER (DESCRIBE IN ITEM D. BELOW)

D. IF (A.1) IS NOT MARKED, ENTER NAME OF SUBSTANCE STORED: C.A.S.#:

III. TANK CONSTRUCTION MARK ONE ITEM ONLY IN BOXES A, B, AND C, AND ALL THAT APPLIES IN BOX D AND E

A. TYPE OF SYSTEM	☐ 1 DOUBLE WALL	☐ 3 SINGLE WALL WITH EXTERIOR LINER	☐ 55 UNKNOWN
	☒ 2 SINGLE WALL	☐ 4 SECONDARY CONTAINMENT (VAULTED TANK)	☐ 99 OTHER
B. TANK MATERIAL (Primary Tank)	☒ 1 BARE STEEL	☐ 2 STAINLESS STEEL	☐ 3 FIBERGLASS
	☐ 5 CONCRETE	☐ 6 POLYVINYL CHLORIDE	☐ 7 ALUMINUM
	☐ 9 BRONZE	☐ 10 GALVANIZED STEEL	☐ 55 UNKNOWN
C. INTERIOR LINING	☐ 1 RUBBER LINING	☐ 2 ALKYL LINING	☐ 3 EPOXY LINING
	☐ 5 GLASS LINING	☐ 6 UNLEADED	☐ 4 PHENOLIC LINING
	IS LINING MATERIAL COMPATIBLE WITH 100% METHANOL? YES NO		
D. CORROSION PROTECTION	☐ 1 POLYETHYLENE WRAP	☐ 2 COATING	☐ 3 VINYL WRAP
	☐ 5 CATHODIC PROTECTION	☐ 91 NONE	☐ 4 FIBERGLASS REINFORCED PLASTIC
		☐ 55 UNKNOWN	☐ 99 OTHER
E. SPILL AND OVERFILL	SPILL CONTAINMENT INSTALLED (YEAR)		OVERFILL PREVENTION EQUIPMENT INSTALLED (YEAR)
