

James Johnson City of Long Beach Councilmember, Seventh District

Date:

February 5th, 2013

To:

Honorable Members of the City Council

From:

Mayor Bob Foster

Councilmember Gary DeLong, Third District

Councilmember Patrick O'Donnell, Fourth District

Councilmember James Johnson, Seventh District

Subject:

Maintaining our City Infrastructure

RECOMMENDATION:

Request that City Management present an updated report to the City Council on the status of our infrastructure and the funding of ongoing maintenance within 60 days.

DISCUSSION:

One of the core responsibilities of municipal government is to maintain our public infrastructure, such as streets, sidewalks, and public buildings. In addition to the safety and quality of life benefits of such infrastructure spending, maintenance saves considerable amounts of money over the long run by preventing costly repairs and replacements. Thus, maintaining our infrastructure is not only the right thing to do for current residents, but also our obligation to our children and other future residents for whom we should leave the city in at least as good a condition as we found it.

In addition to recognizing and addressing unfunded liabilities, proper infrastructure maintenance and repair is also part of prudent fiscal management. The City Council received a report on the status of our citywide infrastructure in 2011. Based in part on that report, the City Council has made positive changes to its approach to infrastructure. These include the re-institution of residential street maintenance (slurry seals) after ten years of deferring maintenance and the set aside of one-time funds for infrastructure funding. It is appropriate that we now receive an updated report regarding infrastructure and maintenance funding for our consideration.

Among other items, the update should include the ongoing shortfall for residential street repair and maintenance, sidewalk repairs, and public building maintenance. Analysis regarding future savings that could accrue from properly funding maintenance should

also be included. Moreover, spending on residential streets and sidewalks, both in the General Fund and in all funds, over the last ten years is requested to give context to our historical levels of investment for these critical pieces of public infrastructure.

As the Mayor highlighted in this year's State of the City address, much still needs to be done and infrastructure will be a focal point for the coming year. Our streets, sidewalks, public buildings, and systems all need repair. We need to plan now for how to most efficiently maintain and repair our infrastructure in a way that utilizes our resources for the greatest good.

FISCAL IMPACT:

There is no significant fiscal impact for this report. To the extent that infrastructure maintenance spending is increased, there could be a corresponding amount of long term cost savings from preventing deterioration. For example, the American Public Works Association estimated that cities save \$6 in street repair costs for every \$1 invested in maintenance.

- Capital Projects Shortfalls
- Vaintenance Snortalis
- Annual Funding Requirement
- Summary

Successes:
Completed Projects
(Past 3 Years)

Arterial Streets

- 48 lane miles of arterial streets repaired
- Pavement Condition Index (PCI) increased from 45% to 68% "Good or Better"
- Best overall street condition in 10 years

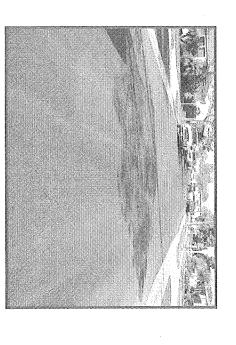

\$65,150,000	Total
4,300,000	Federal Gas Tax
900,000	State Gas Tax
800,000	Prop. A
13,100,000	Prop. C
31,750,000	RDA
\$14,300,000	ARRA/Stimulus
3-Yr Amount	Funding Source

Residential Streets

- 84 lane miles of residential streets repaired
- Pavement Condition Index (PCI) increased from 36% to 52% "Good or Better"

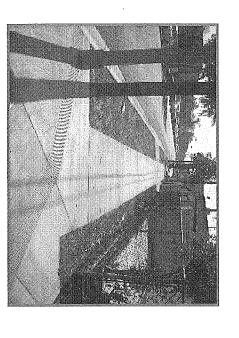

\$26,650,000	Total
2,000,000	General Fund
2,500,000	Measure R
5,350,000	State Gas Tax
14,300,000	Prop. 1B
\$2,500,000	RDA
3-Yr Amount	Funding Source

Sidewalks & Alleys

- 22 miles of sidewalk replaced
- 4.8 miles of curbing replaced
- **Euclid Alley paved**

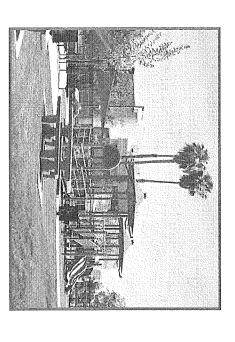

\$9,720,000	Total
6,800,000	General Fund
2,100,000	CDBG
200,000	RDA
\$620,000	ARRA/Stimulus
3-Yr Amount	Funding Source

Parks

- 11 new parks or park expansions completed
- 5 new parks or park expansions under construction
- 6 new or renovated park buildings

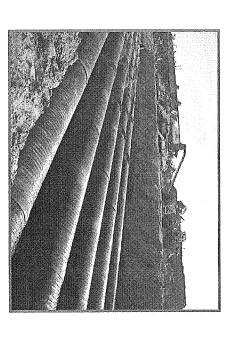

\$54,150,000	Total
1,250,000	Park Impact Fees
300,000	TDA
800,000	CDBG
13,000,000	Grants
\$28,900,000	RDA
3-Yr Amount	Funding Source

Stormwater

- 3 pump station water quality devices installed
- 688 automatic retractable screens installed
- Low flow diversions at new storm drains

Westside, Arlington, and Termino Storm Drain projects

\$16,400,000	Total
1,850,000	General Fund
625,000	State Gas Tax
1,200,000	Federal Gas Tax
3,200,000	Prop C
1,175,000	Tidelands
3,200,000	RDA
\$5,150,000	ARRA/Stimulus
3-Yr Amount	Funding Source

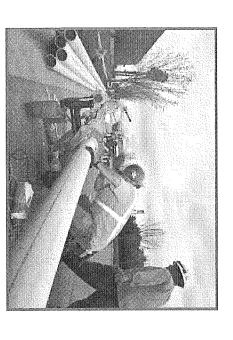

Gas & Oil

- 40 miles of gas main pipeline replaced
- 30 miles of residential gas pipeline replaced

5 underground pipeline pressure control stations replaced

24,500 of gas meters replaced

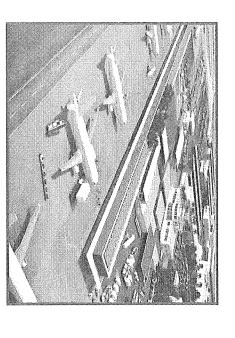

\$24,000,000	Total
\$24,000,000	Gas Fund
3-Yr Amount	Funding Source

Airport

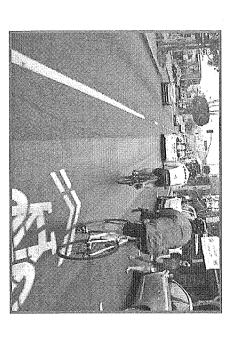

- New parking structure
- New terminal under construction
- 320,000 square feet of taxiways replaced

\$138,000,000	Total
\$5,000,000	PFC
\$30,000,000	FAA Grants
\$103,000,000	Airport Fund
3-Yr Amount	Funding Source

- 32 miles of bike lanes added
- Sharrows, protected bike lanes, and a bike boulevard installed
- 1,500 bike racks installed
- **New BikeStation**
- New Transit Mall on 1st Street

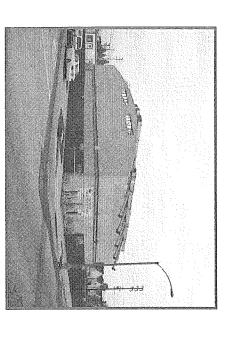

\$6,722,000	Total
1,700,000	Prop C
450,000	State Gas Tax (TDA)
922,000	Grants
1,350,000	RDA
1,300,000	TMP
\$1,000,000	ARRA/Stimulus
3-Yr Amount	Funding Source

Public Safety

- New Fire Station 12
- Funding for new East Police Substation secured
- Fueling facilities upgrades
- Gender accommodations

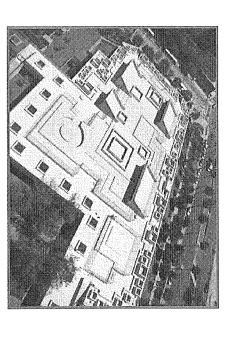

Funding Source	3-Yr Amount
RDA	\$26,000,000
Grants	500,000
Total	\$26,500,000

Libraries & Other City Buildings

- New roof for Main Library
- Critical repairs to City facilities (Roofs, HVAC, etc.)
- Energy retrofits
- Library retro-fits and remodels

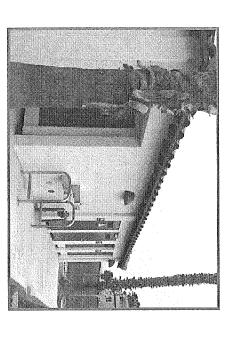

\$6.200.000	Tota
1,000,000	Grants
1,400,000	RDA
1,500,000	General Fund
\$2,300,000	Civic Center Fund
3-Yr Amount	Funding Source

Tidelands

- Seawall repairs
- Convention Center investments
- 5 new or renovated beach buildings
- Alamitos Bay Marina Rebuild

\$48,960,000	Total
18,970,000	DB&W
6,200,000	Marina Fund
\$23,790,000	Tidelands Fund
3-Yr Amount	Funding Source

Executive Summary

This report was commissioned by the Office of the City Auditor of Long Beach and was prepared by Public Financial Management (PFM). The report represents Phase II of the Long Beach Streets Review ("the Review"). In Phase I of the Review, PFM conducted an assessment of the Long Beach Streets Capital Improvement Program (CIP) that identified how the City could make more effective and full use of Streets CIP funding sources; improve budget practices; reduce project backlogs; improve project tracking; and address staffing levels.

The Phase II Review builds on Phase I and focuses on other issues regarding the delivery of streets capital improvements. The Phase II Review is organized into five main sections:

- An assessment of the current condition of Long Beach's streets, and an analysis of how various levels of investment in Long Beach's streets infrastructure may affect the condition of the City's streets over time.
- A comparison of Long Beach's street conditions and streets maintenance practices in relation to other California cities.
- A review of DPW's contracting practices and general approach to contract management.
- A comparison of DPW costs relative to those of other California cities.
- An examination of DPW's streets infrastructure performance measure practices.

The following are PFM's key findings and recommendations for Phase II. These recommendations are followed by the recommendations for Phase I for reference.

• Invest early in preventive street maintenance in order to realize the greatest potential cost savings. Extensive research has demonstrated that it is more economical in the long run to invest early in maintaining streets that are still in good condition than it is to defer maintenance until streets have deteriorated and more expensive repairs are needed. According to a March 2008 The Road Information Program (TRIP) report, a preventive approach to street maintenance can reduce the life cycle costs of a pavement surface by approximately one-third over a 25-year

period. Specifically in the case of Long Beach, the cost of deferring street maintenance at critical junctures in a street's life cycle can mean the difference between applying a slurry seal treatment at a cost of \$0.30 per square foot for a street still in good condition and applying an overlay treatment at a cost of \$2.34 per square foot for a street in deteriorating condition — an expense almost 7 times as great.

- Improve oversight mechanisms for contractor work. Given current DPW staffing levels, any proposed increase in engineering and/or maintenance project volume would require DPW to delegate more management responsibility to its contractors. In order to ensure proper contractor oversight under this arrangement, DPW should increase its use of project tracking reports and electronic communication technology, such as a comprehensive project website. Such a website would include all deliverables and important notifications, as well as a publicly accessible portion to keep citizens aware of traffic delays and construction progress. DPW can further increase contractor oversight through the use of quantitative performance measures, many of which are outlined in this report.
- Implement a comprehensive kick-off meeting prior to the beginning of every project. This kickoff meeting should establish clear objectives, expectations, and lines of accountability for all involved parties in order to improve communication and coordination. Problems and solutions should be documented as they occur and posted on an open forum for the group to review. Following the completion of a project, a project coordinator should use the project tracking system and log to prepare reports that will aid future project managers and build institutional knowledge.
- Extend the use of performance measurements. While DPW currently publishes a list of several qualitative and quantitative metrics which it uses to measure performance, PFM recommends that this list be expanded in order to enable DPW to more efficiently allocate scarce resources; aid DPW in the development and justification of budget proposals; and hold DPW more accountable to the general public for its stewardship of Long Beach's streets. Specifically, DPW should track more detailed information on an annual basis regarding the average pavement condition of its streets infrastructure by street type and geographic area, as well as the total number of lane miles that are slurry sealed, repaved, and reconstructed. In addition, DPW should make greater use of efficiency metrics to gauge the cost effectiveness of key performance outputs. For ease of analysis, DPW should reclassify its expenditure costs in order to better reflect the relationship between street repair costs and street types.

The Importance of Investing in Preventive Street Maintenance

It is important to recognize that while deferring street maintenance in the short run may result in a temporary decrease in expenditures, the long run costs of adopting such an approach will almost always exceed the short run savings.

Two key drivers help to explain why deferring street maintenance typically results in significant increases in long run total costs. The first concerns the rate at which street quality declines over time. Controlling for climate and traffic volume, streets tend to deteriorate only 40 percent in quality in the first 75 percent of their useful life, but then experience another 40 percent drop in quality in the next 12 percent of their useful life.⁸

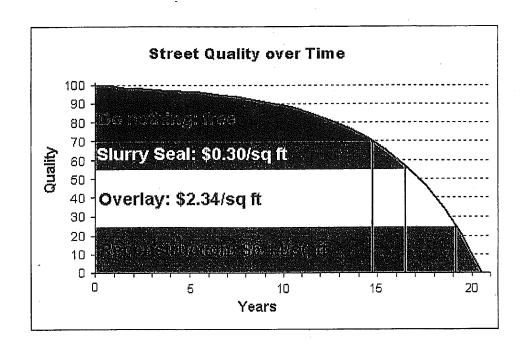

The second concerns the pronounced cost differential between repairing a street in poor condition and repairing a street in good condition. It has been estimated that deferred street repair can cost up to five times as much as early street repair. As the preceding section explains, due to rising construction prices, this gap could potentially widen further.

Accordingly, a short-term targeted investment in maintaining streets that are still in good condition will yield significant cost savings over their useful life.

DPW engineers estimate that an average street in Long Beach will last approximately 20 years. Using current DPW data, the following chart depicts an average Long Beach street's expected life cycle, along with associated maintenance costs at various pavement condition levels. The chart reinforces the general notion that a preventive approach to street maintenance is preferable to a "worst-first" approach, given that the marginal cost of rehabilitating a street accelerates as the quality of a street deteriorates. In addition, the chart indicates specific points along the curve where a targeted investment in street maintenance can realize significant savings. For example, the chart shows that the last opportunity in an average street's life cycle to apply a slurry seal treatment at a cost of \$0.30 per square foot is approximately 16.5 years, after which time the cost of maintenance increases 680 percent to \$2.34 per square foot for an overlay treatment.

The Effect of Different Funding Scenarios on Long Beach's Average Street Condition

The preceding discussion has shown why the return on investment in street maintenance is sensitive not only to size but also to timing. In order to illustrate how Long Beach's average street quality might be affected by both of these investment considerations, PFM worked with DPW's pavement management engineer to run several different funding scenarios through Paver to see what their effects would be on the average condition of Long Beach's streets over a 15-year period. Given the uncertainty of future PPI levels, we ran each scenario assuming 4, 6, and 8 percent annual inflation. These inflation assumptions are generally in line with recent economic forecasts.¹⁰

It should be noted that the following simulations assume a fully optimized use of street rehabilitation resources. In other words, resources are allocated based on their relative rate of return on investment on a citywide basis, without regard to other potential policy considerations. If a different approach were taken to prioritize how resources are allocated, then the street quality curves presented below would have a different shape. It is important for the City to weigh these potential trade-offs between equity and efficiency in the course of developing its overall street maintenance investment strategy.
